```
CAMAPS06.zip and CAMAP5_6.zip have been uploaded to both tapr.org and
muncey.com.  CAMAPS5_6.zip contains only the new maps created since CAMAPS05.

At TAPR.ORG they are in the tapr.org:/tapr/SIG/aprssig/upload  directory
(since I couldn't upload to the upload/pcmaps directory).

At MUNCEY.COM they are in the muncey.com:/public/aprs/calmaps directory.

The new maps include:

KC6UTH's Ridgecrest area and detail city maps.
Tulare, Visalia, Exeter
Tassajara Valley
Alta Sierra
Redding, Red Bluff, Anderson, Shingletown
Monterey, Carmel, Pacific Grove, Salinas
Petaluma, Martinez, Pleasant Hill,
Mohave Desert (Amboy), Yermo, Barstow

Copy the .zip into your top level APRS directory and use PKUNZIP -dn
<filename> to unzip the files. A new MAPLIST.CA is included.

If you have created any more California maps that should be included in the
next CAMAPSxx series, please forward them to me.

It is in beta development right now. Release scheduled for Dayton.
If you are running Win 3.1x you will need Win32s 32 bit subsystem
add on to run it. Win NT and 95 do not require it.

The brothers Sproul are the developers, of MacAPRS fame.

There is a Web page devoted to development. I have some instructions
for getting and installing Win32s if you need it. 73,

Heh Heh!

Thanx for the info on WinAPRS. I just read a message containing the line
"you can really tell when people haven't checked in for a while" and just to
defend myself I have only been
on APRSSIG for a week and have been only reading to see if it was mentioned
and when I didn't see it, I asked. Thanx for all the replies I look forward
to getting my hands on a copy!

I plan to give them a call Tuesday. If you have frequency counter, put the
probe on pin 3 of the Receiver IC & a crystal for 145.79 receive should read
135.090 Mhz. I could get close, but never really get the crystal on frequency.
I suspect they have a bad batch of crystals, since the second one I received
from them was exactly the same, closest I could get to actual receive freqency
was 145.785 Mhz. It works there, but if you have an acurate frequency
counter, close doesn't satisfy me, and I know I'm missing some weak packets
with it off
that much. I plan to ask Jim Sheridan at MFJ to actually put one of the
crystals they are shipping for 145.79, into an in house receiver and check
it before sending me another one. Let anyone who's interested what I find out.

Message-ID: <30E85AB6.2084@ro.com>
Rendered body type: text/plain

Boy here we go again, we have the HF Gate abuser back in our area
W7LUS. This morning in 1 hours time there was messages from HF to VHF
totalling 14,123K, tell me this is not abusing the following:

GATE was designed for HF Boats & Mobiles to relay their movements back
home onto VHF. The NET will choke if VHF'ers use it.

Well i have news for them whenever i see a gate open now i will enter

WIDE,GATE,GATE,WIDE in my path. I have keyboarded with several VE3 stations on HF, what's good for one is good for all i guess. I unregistered from the sig but couldn't pass up posting this.

7. Can K-Net Nodes support multiple aliases?

From: Larry Griffin <largriff@onramp.net>
Date: Mon, 1 Jan 1996 15:26:08 -0600
To: "'aprssig@tapr.org'" <aprssig@tapr.org>
Message-ID: <01BAD85D.7DAC1E20@lub22.onramp.net>
Rendered body type: text/plain

I've noticed a couple of new nodes locally that are now running K-Net Node firmware. I understand it is NETROM compatible firmware for Kantronics TNCs. I've asked support@kantronics.com for more info but haven't yet heard any response (probably because of the holidays). But one of my questions has to do with whether K-Net supports multiple aliases which would allow it to be used as a WIDE-RELAY digi. (That keeps it on-topic, right?)

Hello, William... I've been having the same problem with trying to tweek a higher frequency receive crystal. After sending my 8621 back twice, it seems that I've uncovered a problem with their method of putting the reciver on frequency. For the benefit of the SIG, the present procedure is to put the transmitter on frequency. This is easily done with a frequency counter. After the transmitter is on frequency, a VOM is connected to a Test Point, and then, while transmitting, you adjust the receive crystal slug until 2.5 VDC is achieved. I, too, had problems with the slug falling out the top.

The MFJ Tech Support people are aware of this problems, and will be changing their manual. I have a Memo from them about this problem, but have been away and have not had time to read it thoroughly. If further interested, I can try to provide more information.

73, and Happy New Year to all!

In defense of MFJ, my dealings with them over the problems I've had with my 8621 in getting a higher receive frequency working have been exemplary. All of the people I've contacted have bent over backwards to help, including the radio designer, Rick Littlefield. They *DO CARE* and will do their best to make any customer happy.

Carl may be flying a plane to Poland. Can you find out from Bob if he will share with us if there are any registered users in Europe?

This could be a great HF Experiment for APRS.   Also do you know what VHF frequency is used outside of the United States?

David,

Well I think you have received tons of replys now about WinAPRS, now you
are getting one from the author directly.

Check out

http://www-ns.rutgers.edu/~ksproul/APRS/

for documentation, announcments, etc.

We are expecting to make a public release of beta at the end of January. A
limited beta was released Dec 22 as prommised. Check out the WinAPRS press
release for the announcment that we made back in September, it is also in
the January QST, page 95.

WinAPRS is a port of MacAPRS, it is the same source as MacAPRS and has
NOTHING to do with the APRS code. DOS-APRS is written in QuickBasic,
MacAPRS/WinAPRS is entirely in C.

WinAPRS is written on a Mac, Compiled on a Mac, and debugged on a Mac
(controlling the PC were the actual code runs). It is ONE set of source
code with a few source files specific for each platform.

>totalling 14,123K, tell me this is not abusing the following:

There has been a rash of "abuse" in the chicago area in the last few weeks. It seems as though some new users use RELAY,GATE or RELAY,WIDE,GATE as their path. In the populated area that gets them several repeats, which all then go to hf. There is an attempt lately to discourage the use of RELAY and WIDE in your path at all. Some people have even changed their ALIAS to something other than RELAY so as to try to dampen the effect. The trouble is that the new user does not know how to determine a good path, and thus resorts to RELAY,WIDE,GATE. After all, if you see your digis several times that means you are getting out good, right? I suspect that this issue will continue for a while.

Paul,

I presented an idea to Bob, WB4APR a while back that I have yet to post to the SIG. Now seems like a good time!

I would also like to see users avoid the generic WIDE and RELAY callsigns in areas with mature APRS networks, especially fixed stations. The fact is that one can do an equal or better job of propagating their position data over a wide area by specifiying discreet callsigns insead of the generics.

So, how do we educate the new (and experienced) APRS users so they'll abandon the generic callsigns? Also, how do we inform transient APRS users about digipeater facilities that exist in a given area so they too can quickly learn the topography of the network and specify a more effective unproto path?

One idea that might work would be to have each WIDE digi-operator place a message in Message #1 of the WIDE's TNC PBBS that lists some basic information about how a new or transient APRS user might best configure their UNPROTO path for the area. This information would include the following:

1. Information about this WIDE. Where is it, and what is its service area?

2. Information about other WIDES in the area. Where are they located, and what are their service areas?

3. Reliable digipaths out of the area into other areas. In my area one might include the callsigns that will effectively propagate a packet all the way to New York City and beyond to the north, and southwestern Virginia to the south.

If this became a standard practice, it could be mentioned in the documentation, and new or transient APRS users would simply leave APRS on for a few minutes until they saw a WIDE or two pop up on the screen, then, connect to it and read Message #1. They would receive the necessary information to specify a workable UNPROTO path for their location and purpose.

Jack

18. VHF Aprs Activity in Western Washington

I was wondering if there are any APRS folks running in the Seattle area on 145.79. I live in the Redmond area and do not see any activity on 145.79, other than a BBS and a node switch. (And it eats a lot of bandwidth).

Has anyone actually had success around here?

Thanks,

Jeff -- KD1IT /7

Sorry for the delay in reply, but I have been on holiday for 10 days :-) and now I'm back :-(.

This actually occurred to me about 3 months ago. The "continuous key" occurs between the last beacon time of the UTC day until the first of the next "day" and only occurs when one uses the START XX:XX:XX EVERY XX:XX:XX. If you exclude the EVERY option it does not occur.

Now, Kantronics admits that early releases of 6.0 have a bug and they are willing to replace (at least they did with me) the EROM at no charge. It appears that about the first 3 months of production of the 6.0 chip has the bug. When I got the replacement chip, installed it, set up the TNC and started it out it worked (and continues to work) like a charm.

BTW my set-up is a KPC-3 interfaced with a Garmin GPS-45.

Subject: [APRSSIG:5548] Another KPC-3 problem
From: aprssig@tapr.org at Internet
Date: 12/27/95 15:53

> Last night I found another problem with the KPC-3 and was woundering if anyone else has seen it. I have been trying to call Kantronics but they are not answering their phone.
>
> I am using the TCN is GPS mode tied to a garman45 gps.
>
> The problem: The TNC started sending the same LT line continuously. In doesn't drop TX - it just sends the same line over and over. I saw what had happened and turned it off prior to reaching the watchdog time. I also know the signal was good because when I turned off the TNC I could hear other stations repeating it.

Has anyone else seen this ?

Bill

OK, time to ask a dumb question....
My understanding of GATE is that it links *from* HF *to* VHF. It DOES NOT
link from VHF to HF.

If that is correct, then:
  1) 'GATE' should **never** appear in the unproto path of a VHF station,
and
  2) and 'GATE' station should *not* be gatewaying VHF to HF.

If that is NOT correct, would someone explain the function of GATE in the
unproto path of a VHF station to me please ?

I am *not* a packet user, other than APRS, and my interest there is pretty
much limited to WX for the "local" area here in Minneapolis/St. Paul for the
upcoming severe weather season. Currently, not many users, but there are a
couple of very dedicated users, and three WX stations (including my new
U2000).

(Do/can GATEs operate VHF to VHF? If so, shouldn't they be HGATE or VGATE
(or UGATE) ?) If GATEs are renamed HGATE and V{U}GATE, does that solve any
problems with improving area coverage ? Hopefully, we will run into that
problem here w/WX in a couple of years. The area of desired coverage to the
SW - W of the metro area is out of normal FM range. Linking several local
areas w/VGATE or UGATE would appear to solve the problem. Am I re-inventing
the wheel ?)

Thanks for the help.
73, Donn

Aloha Jeff. I have direct experience w/APRS in WWA. I'm in the Navy,
stationed in Hawaii, and spent July-August in the Bangor/Bremerton area. I
put my portable station up on 145.79, and listened to the BBS you mentioned,
without hearing any APRS activity for over a week. Finally one day I noticed
two CANUKs in Vancouver area up, and I helped them get up over the air. Well,
that apparently pissed off several BBS users (this was all late at night) and
they complained so the digi coordinator shut off the digipeat function. It's
probably still off. They could not understand why I couldn't connect thru the
mountaintop, then into the users in Canada. APRS is unconnected protocol.
Could not get this to sink in. Anyhow, I did a Bremerton map and alot of APRS
track histories over to Seattle. Worked with a Ham in Puyallup and did a map
for ?7QQQ. Also did Spokane county and city maps. I used the wasound and
wasoundn maps, but noticed they need some work. These were uncorrected maps
derived from the USGS 1:2M cdrom. Anyhow, I'm retiring from the Navy soon and
may move to Seattle, and if that happens I plan on putting a digi up on
145.79, to hell with those others on this "experimental" frequency. Boy they
really got me worked up. Well, enuf for now. Good luck. I was not impressed
with the Hams of Seattle. At least with the ones I talked w/on packet and had
a phone call with. Names/callsigns forgotten. Good luck, Dave.

APR REPLY: Thats the way I see it... Although I would phrase it
rarely instead of **never**

> (Do/can GATEs operate VHF to VHF? If so, shouldn't they be HGATE or VGATE
> (or UGATE) ?)

APR REPLY: For now, all dual port TNC's only use one gateway call for
both directions. I agree, though, that if anyone sets up a cross band
VHF/UHF gateway, they should use VGATE or UGATE... NEVER use GATE for
that application.

IF I were operating a gate, and the author of the program said that only
mobiles should beacon on gate, then I'd budlist the offender and just
fix the problem right then and there....

AH HA there lies a problem and I 'd like to hear APR comments too..

Lets say we want to establish a 40 meter net for statewide activity.
(or 80M net)

Lets say, we wanted to SEE those stations all over the state...
Then to do so, they have to unproto into a gate. Follow me close now..
If there is 1 guy on 30 meters (ALIAS GATE) and another on 40 or 80
meters (ALSO ALIAS GATE) then they will both digi the offenders
gate beacon.
Here is my thought...
Why not establish an alternate alias for the local HF gateways,
like FLGATE or something like that (Bob can deciede)
Then this allows us to see ALL OF THE local stations throughout the state.
AND keeps us off the 30 DX gateways.
I personally would like to see (in FLORIDA) a 40 or 80 meter HF
gateway stations (espcially 40M). Then we can see all the guys all over the
state..maybe even the mobiles...
Also, came up with another idea for the stamp computer:
When Im driving if Im going fast, id like to Beacon more frequently.
If Im at a light, I dont need to tie up the freq with beacons.
I suggest a stamp computer to read velocity, and change the beacon
timing as needed. Also the stamp could detect if the beacons were not
digi'd (If your not using a computer in the car) and alert the driver.

Comments??
MIke KD4EMI@AOL.COM

Not true around our area, why should GATE NEVER apear in a VHF unproto
path. Is it simply because HF'ers say so. If this is the case then i suggest to
them that they should be responsible enough to only use the GATE for what
it was designed for (THEY ARE NOT DOING THAT). Therefore it is only fair to
VHF users to add Gate to their path. This last Sunday morning there where
several HF gate users in the area and all they where doing (As Always) using
HF<-> VHF to send messages back and forth (Including like always) using the
bulletin function of APRS to do so. As far as i could see the VHF APRS came
just about to a standstill. The NAG message in APRS that comes up when a

VHF station adds GATE within his path clearly states what GATE was designed for, so why is there not a message going the other way. I know HF'ers are not suppose to be able to bring VHF to a standstill as the other way around, but believe me they can!. So far (And this may be drastic) the only thing that works, at least for me is to add gate tp my path and keyboard with some HF'ers and also to send some warplanes at the offending station. Sure would be great if Bob added some war material to that portion of APRS Hi Hi. It worked the last time when i send several jets at his station and when they got within striking distance then set his QTH on fire (I was realy just playing) but he took the hint and didn't see him for month's (But he's back again).

And yes i'm back on the sig for those that don't like it i have to say Tuff you know what!. And for those that have send me many, many supporting messages that i should get back on here. I THANK YOU FOR THE SUPPORT.
I also have on hand several fireproof suites so flame away, i can stand the heat, but have a right to cut out of here when warrented Hi.

25. Train Trip Report

From: randyh@gvgadg.gvg.TEK.COM (Randy Hall)
Date: Tue, 02 Jan 1996 16:21:22 -0800
To: aprssig@tapr.org
Message-ID: <9601030021.AA01614@gvgadg.gvg.tek.com>
Rendered body type: text/plain

Well, I'm now home and the train trip is over.

The trip was a lot of fun. We had a nice compartment to Chicago, friendly AMTRAK staff, and good food. The train was about 2 hours late into Chicago, but we still had an hour and a half for dinner before leaving. From Chicago, we had a really small compartment, so I did not set the APRS station up. Saturday morning I did pull out the GPS-45 and checked our speed and ETA to the next stop. At times, the train would get moving up to 80 MPH.

The GPS\APRS system seemed to work pretty good. The main problem was getting the GPS receiver to lock looking out the train window. The GPS would either be locked or unlocked for hours at a time. I found that the stock GPS-45 antenna seemed to work better than the Garmin active that I also had. When the GPS was locked it was fun to watch the choo-choo symbol move across my laptop's screen. My wife would check the GPS to see how far away we were to the next town.

I saw activity leaving Sacramento climbing the Sierras going into Truckee. I saw one station SE of Denver and a few more stations as we were coming into Chicago. I probably heard better than I got out.

All the equipment worked good. The pico packet TNC, with a new prom that came the day before I left, worked OK. I did see that the APRS must of been sending the pico something that it did not recognized, and about once a day I had to reload some of the parameters back into the pico. Just little nits, something for me to fool with and learn more about the interrelationships between various pieces of equipment.

So, it was fun, everything worked, and I would do it all again!!!

Randy

26. Attention Florida APRS Users!!

From: n2czf@gate.net
Date: Tue, 2 Jan 1996 19:57:23 -0500
To: aprssig@tapr.org
Message-ID: <199601030057.TAA43068@osceola.gate.net>
Rendered body type: text/plain

This message is for all Florida HF APRS users or APRS stations that have HF capability.

Early last year I conducted a test on 40M with several stations including G3ZFJ (who is now in NY) KO4HD and WA4MEJ. All in different sections of FL and with some level of VHF APRS activity. This test was conducted to examine the possibility of a statewide network based on a 40M backbone that could reach to surrounding states but be limited in distant QRM. THe test seemed to prove successful but was very short to come to any solid conclusions.

We are now at a point where most major metropolitan areas here do have some sort of APRS actiivity on VHF and the smaller ones just need some "work" to bring more users into the network. APRS interest here (esp. the panhandle) is geared towards Skywarn and Emergency communications. Up till' now we did not have enough trained users to validate it's use in a large scale but I think we are about there now. At this turning point I think it is time to re-test some alternate links as was done last year and try to get a few more GATEWAY's up throughout the state so that we can all be linked without needing a distant digi as we do now on 30M.

Please contact me and let me know if you have GATEWAY capabilities or just a single port TNC, and if you can be on the air 24hrs a day or just during a limited time. I think we need at least 1 full month of continuous operations and probably more like 2 to come up with some solid conclusions on what we can and cannot do. If you can't participate for the whole test that is ok but I do need stations at all the distant points in the state and in the center to be on a bit more than "occasionally" so we can substantiate our test results.

The VHF network is WONDERFUL at least here on the SE coastline, and the central coast and Orlando are starting to pick up. Tampa has always had a good system but no matter what we do we CANNOT have a statewide net just via the VHF paths. We have linked much more than what I thought we would have been able to in a very short time but the goal of APRS here in FL is a STATEWIDE EMERGENCY RESPONSE Network in addition to local. We can only do this on 40 or 80 meters so let's start planing on a SIGNIFICANT test so a decisive decision can be made on a band and frequency. Not only that, we will have a better understanding of what the bands can and can't do at different times of the day.

Send me your ideas nd let me hear from the Panhandle and SW coast, I know there are some of you out there somewhere....BTW no dates yet! I want to gather data first from participating stations and sync everyone so that the test can be as controled as possible.

We had a small misunderstanding with your dates, Randy, but I did manage to get several packets from you when the train stopped in Provo, UT. I didn't have APRS up earlier (not a 24 hour operation here!), so I wasn't able to track the whole Utah portion of your trip.

Unfortunately, you were also a week ahead of our WIDE's intermittant operation on the mountain top!

Hope you can do it again soon -

GATE is the alias set in the tnc that allows the tnc (not aprs software!) to
automatically digipeat on THE OTHER port when GATE is next in the unproto
path list. This is a two way street. GATE is a valid path component for
anybody WHO HAS SOME INFORMATION OF VALUE WORTHY OF the nationwide party
line running at 300 baud that we call aprs on 30m. I encourage anyone who
has access to an hf tnc and hf radio to give a listen to the 30m aprs freq.
and see some of the useless info that shows up there!!!

WB4APR REPLY COMMENT:

Sounds like a GREAT idea to me.  What do you thing about the following:

GATE14 or GATEDX for 14 MHz
GATE10 for all 10 MHz gateways
GATE7  for all  7 MHz gateways
GATE3  for all  3 MHz gateways
GATE9  for 9600 baud gateways
GATEX  for cross band VHF to UHF
GATEFL for Florida (for what ever freq they may use for their STATE)
etc...

If anyone sees a problem with this, lets us know...

I guess I'm confused (which is nothing new) but I thought that GATE was to be
used in an HF path but not in a VHF path.
If a VHF station puts Gate in his path and there is no VHF station with Gate
as one of his alias's nothing is going to happen Right?
Next question is;  If there is a mobile,lets say a RV'er who is operating on
VHF but would like to get his position shown, to the folks back home,
Shouldn't he be able to use GATE?
Seems to me that it all comes down to the old story about being a ham and
showing SOME responsibility for ones actions!
APRS is a GREAT program both as a tool and as a toy.  Lets not spoil it by
getting into the old quibble mode. ACT YOUR AGE and have fun.

Bob's idea forces mobiles to know what gate is going to be up at any time in their area (or across areas if it is a cross country voyage). I suggest that we stick with only two HF gateways. 1) GATE to be used as we have in the past and 2) LGATE (local gate) for the "state wide" other frequency gates. GATE would be used for 30 M thru 10 M (DX frequencies) and LGATE for 80 and 40 M. This would allow a mobile to set the TNC once (especially if stand alone) and still be seen. Then the HF operator becomes responsible for assigning the appropriate GATE name to his/her station.

WB4APR REPLY COMMENT:

Sounds like a GREAT idea to me. What do you thing about the following:

GATE14 or GATEDX for 14 MHz
GATE10 for all 10 MHz gateways
GATE7 for all 7 MHz gateways
GATE3 for all 3 MHz gateways
GATE9 for 9600 baud gateways
GATEX for cross band VHF to UHF
GATEFL for Florida (for what ever freq they may use for their STATE)
etc...

If anyone sees a problem with this, lets us know...

39. 440 APRS Freq?

From: Jess Girard <girard@panix.com>
Date: Wed, 3 Jan 1996 14:05:50 -0500 (EST)
To: APRS Sig <aprssig@tapr.org>
Message-ID: <Pine.SUN.3.91.960103140052.3854A-100000@panix.com>

Rendered body type: text/plain

Hi Al:

A friend, Paul Danzer, n1ii, asked me whether there is an "official" 440 frequency for APRS in the NY/NJ/CT metropolitan area. I know someone (k1trs maybe? I can't remember here at the office) is beaconing that he's on 440 in the Hartford area but I don't recall anything official down towards the NYC metro area. Can someone add anything to this?

Thanks in advance for any help. I unsubscribed to aprssig for a while so I'm presumably not caught up. I have re-subscribed, so you may simply reply to the SIG address rather than to me... or whatever.

Jess ND1L

40. APRS for Windows?

A couple of stations in the NY area are beaconing that they are running beta versions of the APRS program for Windows.

I sent a one-liner to one such station (and got an ACK) asking for the source of the program, but he didn't reply. Having unsubscribed to aprssig for a while I'm not up on what's doing. Is the beta version freely available yet?

You are correct Bud on every count. The only reason a VHF user should not put Gate in his path because VHF is 1200 Baud anf HF is 300 Baud therefore the VHF message going out would slow down the HF system by a count of 4.
Your also right in that the HF gate was designed for an RV or Boats etc to relay their position back home (BUT NOT) for general use as sending many many messages back and forth (Including using the Bulletin Function) from HF to VHF.

> set up an AEA TNC.

I can only assume that when you say "AEA TNC" you are refering to PK-88 as AEA makes several different models. I have been in communication with Bob with regard to problems with APRS not working with the PK-88 and hopefully this will be resolved shortly. The problem comes about as the result of APRS sending a "VHF ON" command to the PK-88 causing it change the "TONE" setting from 3 to 2. My temporary solution was to patch the executable to change the "VHF on" string to "VHF   ". After that patch, APRS works with my PK-88 just fine. I found this necessary as the "VHF on" gets sent to the TNC after the contents of AEAINIT.TNC gets sent.

```

He should be able to, but due to bandwidth considerations, probably shouldn't do so. This is why we need to establish internet wormholes for APRS, to give us another way to DX. There has been some discussion on this list about this subject; is anybody actually doing anything or even still talking?

Some have suggested IRC; since some IRC SysAdmins might not like that idea, telnet is another idea. Nothing can be done along these lines unless we have software to "bridge the gap" between the net and APRS. Is anybody thinking about this or maybe even writing software?

Some DDE Execute protocol "hooks" in MacAPRS for Windows would be nice for a start, but for technical (and other) reasons that is unlikely to ever be seen.

Of course, more has to be done than just pipe APRS beacon-text back and forth on the net, since the Net->Radio link operator is probably not going to want
every net-repeated station, but those are the details...

On Tue, 2 Jan 1996, someone complained:

> ... why should GATE NEVER apear in a VHF unproto path?
> Is it simply because HF'ers say so?...
> Therefore it is only fair for VHF users to add Gate to their path!

WB4APR REPLY COMMENT:

No.  Please THINK. It is simple arithmatic.  The capacity of the single
HF APRS channel at 300 baud is about 7 packets per minute.  This is
because a typical packet is 3 seconds long and due to colisions the maximum
theoretical throughput on such a shared channel is only 36% of absolute
capacity.

Lets say that we have 33 HF gates and only ONE ego-station in each VHF
area puts gate in his path and averages only one packet every 4 minutes.
THAT IS 100 PERCENT of the 300 baud HF CHANNEL CAPACITY!
NO ONE ELSE CAN USE THE CHANNEL BECAUSE IT IS SATURATED!

CONVERSLY, In your local VHF area, you have ONE GATEway station.  If
there are 33 HF users on the HF channel sending one packet about
every 4 minutes each, that is a FULL HF CHANNEL, but your 1200 baud
VHF packet channel is only seeing 7 packets per minute from the HF gateway...
This represents only 11% of your channel capacity.  Hardly worth all the
fuss.  NOTE!  THere is NO way that the HFers can use any more of your
VHF capacity than 11% even if they are on the air 100% of the time!

Please leave the HF channel for the HFers, and the occassional VHFer that
has something of naitonal interest.  Why let a few VHF egos kill the
whole natiowide network so NO ONE can use it?
```

Ok, now we are going somewhere with this gate issue.

In defense of some operators, and we know who they are, who qso
through gates, etc, this really a problem.

In S. FL we have a very active net with some people who set their
beacons to xmit alot !
Combine this with the HF gate qso's and the # of stations on our freq,
this really slows down things...

Now, we all want to be good operators, and Im sure that the guy
who we are talking about wants to be one too...
MAYBE, just maybe, he doesnt realize that he should set his unproto
to the callsign of the HF gate of the guy that he;s talking to on HF.
Then, not every gate in the US will grab his acks and qso data.
Isnt this simple...IF your on HF, just change your UNPROTO PATH
from gate,wide to <CALLSIGN OF GATE STATION, WIDE >
then we all dont have to hear abt the complaining.
I'll bet he isnt on this sig (I dont think he is)
Why dont we remind him that the above method would make
everyone happier...?
Im sure he would want to do the right thing ..?!

Rendered body type: text/plain

I think Bobs idea is too complicated, though it would be an effective
way to organize the paths.
Perhaps Im too short sighted..here is my fix
(and this is what Sam KO6JR proposes)

#1
Gate is for dx (i.e. 30 meters or even 20 or 17 !)

#2 LGATE is for 40 and 80 meters.

Selecting XXGATE for XX being the state would be a major problem.
With ajoining states, there would be sharp borders as to who would be
seen. Not good if your near a state line.

As for 9600 gates, UHF gates, etc, Hmmmm
that complicates things...I think that UHF is being used to
LINK stations. If so, then it would be able to repeat everything,
gates, LGATES,and any other unproto that is seen.
Im not certain but I dont think there is alot of 440 activity at this point.

So summary is
GATE=30 METERS (or 20 or 17 for dx)
LGATE=statewide gate. (whatever band prop allows)
Please note..stations should not put more than one gate in the
unproto to avoid getting repeated into other states.
Is this covering the bases...Why not try it?

Is this any better or closer?

You are so right Bob, the theory sounds great, but when sitting in front of my
monitor and seeing nothing but messages (I'm talking nothing but) from Hf
users it gets frustrating and makes me wonder why are they using VHF at all.
Are they so hungry for attention or what. I don't see why we need HF gates at
all unless there truly are some users that want to beacon their position back
home via VHF. But say what anybody may when HF Gates start screwing up
what i have been working to build up on VHF for years i for one will not let
them. Don't get me wrong i'm not talking about the position beacons or WX
stations. I enjoy seeing them show on my map as much as anyone else, but
when the messages totally screw up VHF so i have to sit here and watch it
fill screen after screen then i have to do something since they just want to
continue. The day in question there where 68 users on my map so if all those
where sending message after message don't tell me it would tie up VHF also.
I don't know about percentage here and percentage their, all i know is what
i have to put up with every weekend. Ok HF'ers start turning on the flames,
but before you light that flame think of this. If you have used HF to gate to
VHF to send messages back and forth then you are as guilty of abusing the
gate then i would going the other way Hi Hi.

Oh on, here we go again. From the complete lack of consensus when I
brought this up a few months ago I thought it would be awhile before it
came up again. To add my two cents worth...

I still feel that it is fine for a VHF station to gate onto HF with
position and weather reports, those are what I like APRS for. It would be
nice to have better support for different VHF and HF paths, I know
MacAPRS now supports different beacon freqs for HF and VHF, although I'd
like to see a way for the VHF only user to enter different freqs for a
path with GATE and a VHF only path, but that will come from Keith and
Mark eventually.

The bottom line as I see it is that everyone is free to do what they
want, and we all have to give people the room to do that. If something
they are doing annoys us, we can try to educate them, but ultimately the
only solution is to use the off switch. Personal attacks accomplish
nothing.

I have a program currently working on the Mac which allows a serial port
to be used over an EtherTalk network by multiple programs. I am in the
process of adding TCP/IP support. This will allow any internet user to
hook into any TNC output stream, and even to completely link LANs. There
is no need for any special protocols, it is simply a stream of characters
in each direction, would be easy for someone to write a WinSock version.
If anyone has the knowledge and desire to do this, let me know so we can
test our version together. BTW, the socket number I'm using is
14579...wonder why I picked it???

I beg to differ on the "no need" answer.

On one hand it is entirely possible to have an antenna with a horizonally omni-directional pattern and a gain of greater than 9db (or any other arbitrary number).

And on the other hand, as far as antenna patterns go, you have a very loose definition of what is "adequately represented". Personally, I feel that these PHG circles are nearly completely useless representing any kind of reasonable beam antenna.

I would really really really really really like to see the PHG expanded to something with more information. (Did I put in enough "really"'s to get my point across? :-)

To really plot the pattern, I think you need (in addition to nearby terrain features which a mapping/database program can provide) at least:

Power, Antenna height above ground, alititude of the local ground,
antenna gain, antenna beamwidth, and beam direction.

If you must quantize these into a tiny fixed format, may I suggest something like the following, but a variable length, free format would be much more desirable to me:

```
Power     1500, 1000, 750, 500, 350, 225, 150,
          100, 75, 50, 35, 22.5, 15,
          10, 7.5, 5, 3.5, 2.25, 1.5,
          1, 0.75, .5, .35, .225, .15, .1 Watt)
          A=0.1 watt, Z=1500Watts   (ready for hf or eme)

Antenna Height above local ground (in meters 1, 1.5, 2, 3, 4, 6, 8, 12,
                                   16, 24, 32, 48, 64, 96, 128, 196, 256
                                   384, 512, 768, 1024, 1536, 2048, 3072,
                                   4096, 6144
                                   This should cover most conditions,
                                   even the edge of a cliff or top of a
                                   mountain antenna tower, but not
                                   spacecraft.

Altitude of local ground (in meters) same quantization.

antenna gain (dbi or referenced to a 1/4 wave verticle) in best direction
             0-9 plus A-Z for 10 to 35db (look out eme-aprs!)

beamwidth  (in degrees at 3db down points ie. half max)
           360, 275, 180, 170, 160, 150, 140, 130, 120, 110, 90, 80, 70,
           60, 50, 45, 40, 35, 30, 25, 20, 15, 10, 5,

beam direction (more resolution than just a couple of compass points, say 0-9
                and a-z for ten degree resolution or 0-9, a-z, A-Z , and say,
                !@#$%^&*() for five degree resolution
```

Hey it would only take a few more characters, and make it would make the patterns MUCH more useful, at least to me.

minumum:
PHAGWD six characters.

Highly prefered, fully expanded, non-quantized, variable length,
easy to read format:
P in watts
H in meters
A in meters
G in dbi
W in degrees
D in degrees (optional for omnidirectional [W=360] antennas)

examples: P1500H15A1500G6W45D135 or P.001H1A135G2W360

> And increasing the circle size much beyond about 9 dB makes little sense,
> because your range is more limited by the radio horizon than any amount of
> additional power (or bigger circle...)

Calulations in the drawing routine should take this into effect. You shouldn't have to put in a bunch of hand tweeked numbers which do not reflect the actual parameters of your station, to get a reasonable representation of the approximate pattern of your station, otherwise you might as well just enter and transmit the coverage radius in km.!

Chuck

Mike... that won't work, the gate thing and WIDE. Unless a station changes MYGATE to a actual callsign you can't gate to HF using his callsign, that will only digi you on VHF via his station.

Default on a KAM is eg: MYC KD4EMI, MYM KD4EMI-1, MYGATE KD4EMI-3, etc. that will then work I go UNPROTO APRS VIA KD4EMI-3 and I end up on HF. As soon as you change MYGATE to GATE if you attempt to avoid using the generic alias of GATE and change to UNPROTO APRS VIA KD4EMI that will only spit you back out on VHF.

Close only counts with demolition grade explosives! (Another one of my loves)

Bob:

I need some help!

I'm trying to install a new Ultimieter 2000 with aprs....Both things are new to me. I previously ran a Ultimiter II with PKGold, an AEA 232MBX, and a Compaq Deswkpro 386 with 1 meg of RAM and a VGA color monitor. The system ran fine till I installed the Ultimeter 2000 and the new APRS74E.

We had a little bit of trouble with a cable (using Peet Bros cable) but got it working. During the problem solving for the cable, we re-booted and the color disappeared. We also got a "comm buffer overflow" message in the upper right corner of the screen and the system locked up.....We had to re-boot and start over. This occurred while were were looking at the Ultimeter 2000 data stream in APRS.

Can you suggest a reason for the loss of color? Or for the lockup in in APRS?

Would appreciate any help you can give.

Message-ID: <01BADA26.4270A180@port-7-29.access.one.net>
Rendered body type: text/plain

Bob:

Some additional information on my previous message that said:

I'm trying to install a new Ultimieter 2000 with APRS....Both things are new to me. I previously ran a Ultimiter II with PKGold, an AEA 232MBX, and a Compaq Deswkpro 386 with 1 meg of RAM and a VGA color monitor. The system ran fine till I installed the Ultimeter 2000 and the new APRS74E.

We had a little bit of trouble with a cable (using Peet Bros cable) but got it working. During the problem solving for the cable, we re-booted and the color disappeared. We also got a "comm buffer overflow" message in the upper right corner of the screen and the system locked up.....We had to re-boot and start over. This occurred while were looking at the Ultimeter 2000 data stream in APRS.

Can you suggest a reason for the loss of color? Or for the lockup in APRS?

New information:

We found the color problem...it was caused by a static charge and re-connecting the cables to the monitor eliminated the problem.

Regarding the more serious issue of the "COMM Buffer Overflow", we continue to have a problem. The system works fine as long as its just gathering data, or as long as we are in a APRS receive or transmit mode. If you go to a non-APRS processing mode such as the terminal program, or the save mode, you get the "COMM Buffer Overflow" error and the system locks up!

Can you tell me the cause, and more importantly, the fix?

Again, I appreciate your help in this matter.

Regards,

R. Otto

William Nolle wrote, here copied verbatim:
>Don't get me wrong i'm not talking about the position beacons or WX
stations. I enjoy seeing them show on my map as much as anyone else, but
when the messages totally screw up VHF so i have to sit here and watch it
fill screen after screen then i have to do something since they just want to
continue.

--End of quoted material--

As a relatively new user of APRS, on both VHF & HF, I have paid particularly
close attention to the etiquette of using this mode, subscribing to the
theory that God gave us two ears and one mouth to be used in that proportion.
 For the better part of every day in the past week, I have been active on HF,
and have monitored the messages being sent on 101515.  For the life of me, I
can't figure out what Brother Nolle is talking about, with *screens and
screens* of messages being ported from HF to VHF making his life miserable.

In the past week, I have learned a lot about propogation, and the lack of it
for the most part, the 10.1515 frequency was seldom very busy except for the
early evening hours.  Perhaps it was holiday inactivity.  But I would rather
see some of the *screens after screens* of messages that Brother Nolle was
talking about (yes Bill, you may copy them and send them to me) before
jumping on his bandwagon and making a rash judgement that might turn
potential APRSers away.

Perhaps his station is seeing multiple GATES, that are causing duplicate
packets to be received at his location.  But from where I sit receiving,
<IMHO> there just isn't THAT much activity and there are far greater problems
to worry about than this.

Bill, I am trying not to let the way you are delivering your message get in
the way of what I think you are trying to say, but sometimes it sure is hard.

Well, that is the basic problem isn't it Mike....unlike digipaths, you
cannot set the GATE call in the path...the KAM only has one slot for the
gate call...that is either an alias or a callsign -ssid combo...not both.

I like BOB's idea...GATEx with x detailing a specific path....simple
enuff to change on the fly if you are mobile but specific enough to
prevent QRM to the whole nation.

Good morning. Name here is Bob, N1EDM. I am interested in APRS and saw a BBS msg from W4VIW saying that his BBS at 864-299-6185 had APRS 7.04C on it. Unfortunately, I am unable to connect to this BBS, as the phone number appears to be incorrect.

Could you please advise me what the latest version of APRS is, and where I could download a copy from? Thanks. There appears to be a few folks in my area who are already on it and I wanted to see what it was all about. Thanks for your help.

Message-ID: <199601041453.JAA07514@hemisphere.neocomm.net>
Rendered body type: text/plain

I use an AEA PK-232 and have added a switch to the backup battery jumper, which is located through an access hole, underneath the PK-232. Pakrat and other AEA software automatically sets the PK-232 into propritory "HOST MODE", to leave this HOST MODE the manual says Turn off tnc, Remove all power, Remove backup battery jumper, wait several minuets, Replace jumper. This procedure does indeed get you out of the proprietory "HOST" mode. Now you can run most any standard ascii terminal program such as APRS! Once you run "Pakratt" again you will have to repeat the above procedure, in order to run other programs. Since I experimented with lots of different packet programs I added a switch to the backup battery jumper (it plugs in place of the jumper) now I don`t have to turn the tnc upside down to disconnect the battery. An even better solution is to not use "Pakratt at all, I suggest Packet6.1, its the most versital program I have used. Hope this helps another experimenter...Chas

<<SNIP>>
} I still feel that it is fine for a VHF station to gate onto HF with
} position and weather reports, those are what I like APRS for. It would be
} nice to have better support for different VHF and HF paths, I know
} MacAPRS now supports different beacon freqs for HF and VHF, although I'd
} like to see a way for the VHF only user to enter different freqs for a
} path with GATE and a VHF only path, but that will come from Keith and
} Mark eventually.
}

I second this motion!!

On the KAM+ I have found that I can set the different UNPROTO path for HF and VHF in terminal mode.
Just don't give MacAPRS a UNPROTO path and it will work.

Problem, you can't change a path once MacAPRS is running or both paths are modified.

This is an issue when you want to lower the QRM on a local VHF QSO

```
by going direct or using specific digi's.

} The bottom line as I see it is that everyone is free to do what they
} want, and we all have to give people the room to do that. If something
} they are doing annoys us, we can try to educate them, but ultimately the
} only solution is to use the off switch. Personal attacks accomplish
} nothing.
}

> Combine this with the HF gate qso's and the # of stations on our freq,
> this really slows down things...

APR COMMENT:  I dont see how a maximum of 11% HF burden on your local VHF
network can "really slow things down".  Our East Coast network
extends over 8 states.  YES, the HF is the majority of what we see too,
BUT it is still less than 11% of our channel capacity!
WITHOUT THE HF traffic, we would be lucky to see 10 VHF messages a day!
The local VHFers here keep their chats local

> MAYBE, just maybe, he doesnt realize that he should set his unproto
> to the callsign of the HF gate of the guy that he;s talking to on HF.
> Then, not every gate in the US will grab his acks and qso data.

APR REPLY:  Again, there is a failure to understand how GATEs work.  Only
the GATE callsign will gateway.

In my opinion, I am happy to see the HF'ers using APRS on a daily basis. The
more they use it the more prepared we are during a crisis.  Again, the
place to control HF gateway traffic in YOUR area is to control YOUR LOCAL
GATE.  If you cannot live with allowing HF packets to share 11 % of your
local network, then get your LOCAL APRS users to agree to turn OFF your gate.

> I think Bobs idea is too complicated, though it would be an effective
> way to organize the paths.

WB4APR REPLY COMMENT:

I agree.  My porposal was to allow for all future possibilities.  For now
I would prefer the following:

GATE    for 10 MHz (can become GATE10 later on if needed)
GATEDX  for 14, 18, 24, 28 MHz
GATELO  for local (can be expanded to GATE7, GATE3 or GATE1 if desired)

In any case, I want the SUFFIX to contain the details, so I can just
search for GATExx in the software.  I also agree, that 9600 baud GATES
can simply gate everything since the bandwidth is  there...

```

> that no APRS was allowed through MIR. Why is this?

REPLY: Lack of understanding. Some stations think MIR is their own private mailbox. BUT don't seem to complain about the bazillions of connect requests which actually take up MORE bandwidth. In fact recent AMSAT articles actually ecourage EVERYONE to try to CONNECT with MIR!
They dont understand that if EVERYONE sent the simple APRtrak UI packet instead of trying to CONNECT with MIR, that the actual loading on the channel would go DOWN and access to the PBBS would be BETTER for those needing it. Plus the automatic QTH plotting of the packets that DO get digipeated have greater educational value than all of the DISCONNECT BUSY packets that you see now..

But you cant argue with those who don't understand and are stuck in the 1970's dumb terminal mode...

WB4APR REPLY COMMENT:

The HFers are not using VHF necessarily to irritate you. They are using HF the way we had planned on it being used. If you dont like seeing HF traffic, You have several means totally within your control to solve your problem.

1) Use the APRS CONTROLS-FILTERS-GATE command to tell APRS to not accept any gatewayed traffic
2) Set BUDLIST OFF in your TNC to the HF'ers that you find so objectionable
3) Get LOCAL agreement to turn off your LOCAL gateway station. He is providing the GATE as a service to your LOCAL net. If your local area doesn't want the service, turn it off.

For HFers: Never use anything beyond GATE,WIDE, unless you have a specific purpose in mind. This is VERY important, since it keeps the HF traffic introduced on VHF within the SAME local area as the GATE station.

If you are just rag chewing with no special interest to all the other VHFers out there, you might consider dropping the VHF path.

I agree with part of this. But tell me WHY should i use the OFF SWITCH as this person suggests. I have been using APRS since it's inception and fought hard (Yes fought) to get 145.790 coordinated trough the proper channels. Why should i be the one to turn off my system. Of course this will NEVER happen. At least i'm confident in my use of this frequency in that it is coordinated and have a right to use it for APRS or any other packet related modes. So to the person that made this suggestion i have to say if you don't like me using gate in my VHF path then turn off your switch. And by the way you call this a personal attack, why is this just because i simple name the persons call that get's right on the frequency and calls me crazy and some other fine names. I can take your message as a personal attack also!.

WB4APR REPLY COMMENT:

Yes, but no more than ONE wx report per state please on 10 NHz. Or at least every 256 miles. And then make the WX report rate ONCE per 30 minutes. Detailed WX is of LOCAL interest only. National trends are nice to see also, but nothing of NATIONAL significance changes in 30 minutes..or 256 mi.

If you want a SATEWIDE WX reporting net, then put it on 40 meters.

On Wed, 3 Jan 1996, Chuck Grant wrote:

> these PHG circles are nearly completely useless representing any kind of
> reasonable beam antenna.

APR REPLY: I agree, especially when 90% of HAMS do NOT understand HAAT!. But APRS, designed to be a distributed NETWORK, in general has no need for high gain BEAMS. Maybe I am missing something. What is the value of a BEAM when you can hit the local WIDE with 1 watt into a ground plane? (The DF function is handled differently and is not relavant to this discussion)

> To really plot the pattern, I think you need (in addition to nearby terrain
> features which a mapping/database program can provide) at least:
> Power, Antenna height above ground, alititude of the local ground,
> antenna gain, antenna beamwidth, and beam direction.

APR REPLY: Height above ground, and height of ground are nicely already accounted for in HAAT. Antenna gain and beamwidth are synominous; if you know one, you can calculate the other (unless the thing has hopeless sidelobes) So, my PHG format still does what I want. I AGREE WITH YOU

```
that my CIRCLEs limitation does NOT do well with high gain BEAMS.

What is the application for HIGH gain beams?

>showing SOME responsibility for ones actions!
>APRS is a GREAT program both as a tool and as a toy.  Lets not spoil it by
>getting into the old quibble mode. ACT YOUR AGE and have fun.

Keep in mind that the word GATE is the MYGATE alias of a tnc that
(presumably) has an hf and vhf radio connected to it. Whenever it sees the
word GATE next in the unproto list, it will digipeat it on the OTHER radio
port. Thus if there is no tnc with a MYGATAE of GATE, it will not get
"gated". That is not to say that someone couldn't set a digi alias (MYALIAS,
MYCALL, MYNODE) to GATE and thus act as a simple digi (on the same port).
(This would be unlikely but possible.)

As far as who should use it....Well yes I like to agree that we are all
mature and can cooperate. And I suspect that a vast majority of APRS users
are and do. The issue comes down to communication, understanding and
cooperation. Anyone can and should be able to use a gate. Just keep in mind
that when you do you are taking up at least 4 times the time of a vhf slot
on a single nationwide party line we call 30m APRS. If you have something
that you honestly think is of interest to people outside your local area,
then chances are high that other people will agree. If your message is
intended for a specific station and the only way to get there is via hf,
then do it! But keep in mind that when on a part line, there is a limit to
how long other people are willing to listen to your private conversation!
Todays complaints seem to be coming from people (myself included) who are
now getting tired of houses that don't move and personal conversations that
drag on and on with improperly or carelessly set unproto paths.

>used for 30 M thru 10 M (DX frequencies) and LGATE for 80 and 40 M.  This
would
>allow a mobile to set the TNC once (especially if stand alone) and still be
>seen.

This is certainly a point. Mobiles should not be required to know anything
about the area they are going into, after all much of the time they don't
know. On the other hand 30m is good wide area freq., 40 or 80 m might be
good semi-local band (2m is local). In addition it would be nice to be able
to specify an "APRS regional 9600 baud network" as a path. One should be
able to specify nationwide vs. semi-local, vs local, and maybe even choose 2
of the 3. Hum, this is hard.

Idea: Does APRS need multiple unproto paths like the Kantronics kpc-3 tnc
has multiple paths when in LT/GPS mode? Flame away!

Has anyone had any success in using the PK-900 with APRS74E?

I have tried adding into the C:\APRS\SYSTEM\INITAEA.TNC the following lines

MON 2/2
MODEM 10/4
CHSWITCH $7C
|A
HBAUD 300/1200
VHF OFF/ON

Are there any further comments/suggestions or thoughts for the PK-900?

Hi all im not going to incude any of the past mail on this sub to
save ur time!
i think that the real problem hear is that hf users should also
stay off of vhf unless they have a reason!
iewx or position reports
dont set ur path to gate,wide,wide if ur on hf and just chating
with ur bud's that is just taking up band width from coast to coast!
point 2 if ur a vhf mobile use the alt digis comand to
limmit the # of packets u send out on hf.
if ur using a stand-alone tracker use a pos rate of at max 30min to hf

thanks just a few unorganized thoughts!

.       I AGREE WITH YOU
.       that my CIRCLEs limitation does NOT do well with high gain BEAMS.
.
.       What is the application for HIGH gain beams?
```

The main application for high-gain beams within APRS (IMHO, of course) is for UHF gateways and/or linking two almost-close metro areas without having to use HF. As an example, WIDEs in Chicago and Milwaukee (90 miles apart) can't reliably hear each other all the time (not WIDE enough - hi hi.) Adding a high-gain beam to a Milwaukee WIDE and to a Chicago WIDE, both beams pointing at one another, could allow the WIDEs to hear one another better and possibly relay traffic between the areas without HF usage. Of course, a better solution would be a 9600-baud (or greater) UHF (maybe) GATE, like the UGATE (or was it GATEU...) that Bob suggested.

Anyway, FWIW, that's my high-gain beam application. Of course, there's no need to represent the pattern from such an antenna graphically via APRS IMO, so the whole point of circles not being applicable isn't very relevant.

Hello, Bill... The folks at MFJ are trying to make the 8621 Data-only radio workable at the APRS frequencies. First, there are two versions of the receiver, and you could possibly have the earlier version that would not go higher than about 145.09. I believer MFJ's method of determining the receiver version is by the color of the coil holder that has the slug for setting the receive crystal. My radio was misaligned, and has been set by both MFJ, and checked by Rick Littlefield, the product designer. I haven't checked it out yet, but will really soon. I believe that Rick has suggested a change in the 8621 manual detailing a different method for netting the receive crystal.

The first method they suggest is using a precision signal generator, but no details as of yet on this exact procedure. An alternate signal source is a synthesized 2M radio set to low power and use of a dummy load. Yet another method is to use a counter connected to pin 3 of the receiver chip, which is a buffered receiver output. The slug in L4 can be set so that the counter is reading 10.7 MHz below the desired operating frequncy. (Counter in MHz = Operating Freq in MHz - 10.7 MHz)

So, I guess I would be using this last method if mine was not aligned by the 'powers at be'. I'll have to experiment to see how this all works. In any case, I think this will be an improvement over the original method published in the manual, as there are several people who have had trouble with this procedure.

Mr. Jim Shurden, KB5JNZ, at MFJ is the contact for any 8621 problems. He is very familiar with my radio and is very knowledgeable with the new alignment procedure. I might add that Jim, and his predecessor, Brian Bishop, have been extremely helpful with my problem.

It seems to me that the MFJ 8621 is an extremely good candidate for anyone wanting a good, relatively inexpensive, dedicated radio for APRS, or other 1200 B or 9600 B Packet operation.

> sidelobes) So, my PHG format still does what I want.

This is entirely wrong. The beamwidth in the horizontal and vertical directions can be completely independent. The gain can be calculated from BOTH beamwidths, but the horizontal beamwidth is the only one significant to plotting coverage patterns (for VHF and up anyways).

You need at least two of the three values Gain, H-Beamwidth, V-beamwidth to plot the pattern. If you are making an assumption about the v-beamwidth (either v-beamwidth = h-beamwidth or v-beamwidth = constant) then that assumption will be wrong sometimes, probably wrong a lot.

Chuck

ex. What is the gain of a horizontally omni-directional antenna?
ie. H-Beamwidth = 360. Answer: it can not be calculated only from the H-beamwidth. It could be anything.

Solution for KAM+

If you issue the command unproto APRS(M) via HFPATH/APRS(M) via VHFPATH you can
set both paths to different paths and simultaneously.

When I gate on 40 (which is rare) I use:

UNPROTO VIA APRSM VIA GATE,WIDE/APRSM VIA W6CX-3,WIDE

and I set mygate to GATE

<<SNIP>>
} I still feel that it is fine for a VHF station to gate onto HF with
} position and weather reports, those are what I like APRS for. It would be
} nice to have better support for different VHF and HF paths, I know
} MacAPRS now supports different beacon freqs for HF and VHF, although I'd
} like to see a way for the VHF only user to enter different freqs for a
} path with GATE and a VHF only path, but that will come from Keith and
} Mark eventually.
}

I second this motion!!

On the KAM+ I have found that I can set the different UNPROTO
path for HF and VHF in terminal mode.
Just don't give MacAPRS a UNPROTO path and it will work.

Problem, you can't change a path once MacAPRS is running or
both paths are modified.

This is an issue when you want to lower the QRM on a local VHF QSO
by going direct or using specific digi's.

} The bottom line as I see it is that everyone is free to do what they
} want, and we all have to give people the room to do that. If something
} they are doing annoys us, we can try to educate them, but ultimately the
} only solution is to use the off switch. Personal attacks accomplish
} nothing.
}

> But APRS, designed to be a distributed NETWORK, in general has no need
> for high gain BEAMS. Maybe I am missing something. What is the value of
> a BEAM when you can hit the local WIDE with 1 watt into a ground plane?

Maybe you are not trying to hit the local WIDE. Maybe you don't have a local WIDE. Maybe your local WIDE can't hear what your want to hear. Why limit the system to what is typical for someone only in an extremely favorable location? We are not talking about what is useful to the guy who lives in a metropolitan area with a digipeater every ten miles. There is no law that distributed "NETWORKS" can not benefit from high gain or directional antennas and therefore must use only omnidirectinal or low gain antennas in all cases.

I see plenty of little "house with a beam antenna" icons when I run APRS here in the San Francisco Bay area. People seeme to be using beams...

Come on, you mean to tell me you can't even imagine one use for beams with APRS? We are not even talking about only high-gain beams, but also just directional antennas, or even just situations where the environment imposes a directional pattern when you use an omnidirectional antenna (just accurately modeling situations that can't be avoided, not everyone lives in the middle of a big plain or the top of the highest local mountain).

Suppose your local WIDE is on the side of a mountain so it radiates only over 180 degrees.

Suppose your house, your remote, or your vehicle is on the side of a mountain.

Suppose you are a long way away from the area you want to monitor or report to and the only way you can reach where you want to go is to use a high gain VHF beam. Say monitoring someone hiking in the wilderness.

Suppose you want to monitor the progress of APRS equiped vehicles only along one long straight stretch of highway which heads off into the digipeater dessert, so you point a beam down the highway from a nearby mountain.

Suppose you want to provide a point-to-point digipeater link (with more bandwidth and less competition than hf) between two networks of APRS stations which can not communicate directly, reliably without beams.

Why do people use beams? Because most of the time, GAIN IS GOOD. Sometimes we just need more gain. Sometimes it is important to not hear anything from some direction, so the directional selectivity of a beam can be just as important as the gain. We can not even begin anticipate all the reasons why beams might be used. It seems unthinkable to me to assume that VHF beams will forever be unimportant to APRS, or anything else.

Chuck

Sorry, Kev. You are wrong. Bill is right. For the record, LUS was in town for awhile until yesterday. He was operating VHF and UHF and has now set off again with a tracker. I saw his track down I-85 ON VHF with a path of RELAY yesterday. And the Atlanta Gate is in Peachtree CIty (AB4KN) Peter was asking to be the gate again, but he was gone a long time and we have a new one.

Peter *still* ran his GATE in VHF<>HF mode the whole time he was here, despite the fact that there was already one within the digi range. I'm not judging anyone one way or the other, He has an excellent HF signal. His signal into VHF with his 9 watts is very marginal, though probably causing lots of retries whe people went thru the GATE.

So what is the point of the WIDE, if *all* it has is a super mega high gain
beam pointing to another WIDE?
Unless you are splitting to an omni antenna as well, How is it going to hear
mobiles (which are the purpose behind APRS)- especially Bob when he drives
in with his "wimpy" 1 watt tracker (sorry, Bob).

When I hop off the airplane and hook up the Laptop, GPS, Active antenna,
TNC and rig in the rental car, it is nice to be able to show on the map.
It makes the hassle I get taking the Ammo box thru Airport Security worthwhile.

He was heading to Texas Wednesday. He also told me his TNC barfed on the
way TO atlanta. Looks like he had other problems, 'cause he was using RELAY
on his way out of town Tues or Wed. It was a tracker only, as he told me-
but I saw an @ sign in his posit as he left town. He was trying to get an
HSP working, but could get neither the AEA nor the PACCOMM one to work, even
tho it had 12 volts. I was suspecting a DTR problem with his laptop.

Yes, it will be available. But it has the possibility to cause a bunch of
administrative problems. First of all, imagine two active VHF nets linked
via the internet. Then two more, and two more....and there is the problem
of assuring only licensed hams access it...

As I said, my main reason for writing this is to allow me to use the same
TNC by multiple computers, the internet stuff is a nice side effect. Once
MacAPRS is made compatible, I will post it on the TAPR server.

Please don't take what I said out of context. What I was saying was that
no one, (even those using APRS since the beginning, even Bob who invented
the program) has the right to force their will on others. You try to
convince them with reasoning, if that fails either live with what they
are doing that annoys you, or THEN use the off switch. I was not saying
that YOU or anyone else should use the off switch now. If you bothered to
read my message you would note that I stated I thought that VHF to HF
gating IS appropriate. As to personal attacks, I hate seeing things like
this degenerate into this sort of ugliness. This forum should be a place
to discuss the appropriate use of the frequencies, not to condemn
particular people.

> the 1970's dumb terminal mode...

Bzzzzt! Wrong answer. Thank you for playing.

1. N6JLH is one of the folks who has kept data and help flowing TO Mir over the last couple of years.

2. About 12-18 months ago, there was a problem over California with both rampant digipeating AND APRS activity using virtually all the available overhead time on Mir. Dave got pretty sensitive about that.

3. Connecting to Mir, since it has a max users setting of 1, is self limiting.

4. Not everyone has embraced APRS/APRTrak as the end-all of packet just yet, although for me it's pretty good. I still use TCP/IP for the more mundane packet activities.

5. Dave is hardly stuck in the 1970s or on a dumb terminal. I believe an apology is in order. Oh, yes... Dave's now the stateside QSL manager for Mir.

It's not always as simple as you sometimes think. I learned this with SAREX, and Mir over the last 10 years or so. And, yes, I've been chatting off and on with Mir for that long. Usually in Russian.

>> propritory "HOST MODE", to leave this HOST MODE.....

I wrestled with this problem for quite awhile and now use PkGold Vs. 8.0 software and
set it to default to the COMMAND MODE when I shut it down. Although I power down the system when
I leave the shack for the night, I leave the battery connected. It powers up quickly and I've had
No problems using PkGold for normal packet or APRS for, uh, APRS! The only caveat is to make sure the
PkGold program and the APRS program are set to the same baud rate for PC to TNC, otherwise you have a
delay when you switch programs while the program re-initializes everything.

Hope it helps

Jim Lawyer, AA5QX, Murphy, TX ...nothin' fancy.

On Thu, 4 Jan 1996, William Nolle wrote:

> Again that's great Bob, but how do i know who the local gate is??????

WB4APR REPLY COMMENT:

It should be on your map using the DIAMOND GATE symbol. If not, then send out a bulletin via a single WIDE asking who it is. A single WIDE will get you to ALL/ANY GATE that you are seeing. Do NOT send this query bulletin via any other path, or more than one WIDE, or you will probably find OTHER GATEs that are NOT one HOP away. That will only confuse the problem...

107. APRS has two paths

> Idea: Does APRS need multiple unproto paths like the Kantronics kpc-3 tnc
> has ???

WB4APR REPLY COMMENT:

APRS has TWO paths for BULLETIN/POSITS and multiple paths for messages.
To use the dual paths, select OPS-DIGI-ALT and enter the alternate path.
THen give it a percentage of the time you want it used.

You can send each message via any of the paths in your OPS-DIGI list
```

APR REPLY:  Come on, lighten up.  APRS cant do EVERYTHYING!  APRS already
supports an offset Pattern with probably a 10 dB front to back ratio..
which can be oriented in increments of 45 degrees (about the beamwidth of
such an antenna.

Adding BEAM patterns is beyond the scope of the intent of APRS and WOULD
CAUSE MORE PROBLEMS than it would solve.  How many folks would enter a
NEW PHG each time they MOVED their BEAM????   THen most likely most BEAM
patters would be TOTALLY misleading to mobiles trying to use them.

 And dont even think of expecting me to add an automatic ROTOR INTERFACE!

>
>Terry Taylor, WB5JFM
>a010717t@bcfreenet.seflin.lib.fl.us

Hey Terry, appreciate the info.  Yes I talked with Jim Shurden at MFJ but it
was not until I mentioned your name did he tell me about the different
receivers, was like pulling hen's teeth to get to that...He told me all
about the story of the coils, etc.  Yes I used a freqency counter to try to
align it for 145.79, but the slug fell out before I reached the 145.79-10.7
IF (135.090Mhz).  It is indeed the best way to tune it, but that doesn't
help any if the radio was not designed to accecpt a crystal higher than
145.09, poor designing of a crystal oscillator, which Jim admitted to after
several calls.  I wish some of these service reps out there would give us
hams some credit when you try to tell them something will not work, instead
of telling me I didn't know how to tune the oscillator.  Yes, I could
probably have padded the trimmer or "pulled" the crystal on freqency if they
would have sent me a schematic I had asked for earlier.  Seems MFJ doesn't
want their schematic out for some reason.  After all of the phone calls, Jim
told me to send the Radio to his attention, so we'll see what happeneds from
here on.  He said he would probably have to send me a new radio, so it
sounds like mine is a lost case, old model or whatever...I hope the newer
ones are better than the one I have, it's also broad as a barn door, as I
could copy the SEDAN net on 145.77 with the xtal tuned to 145.785.  Hope I
don't have that trouble if he sends a new one...I'll agree, the radio should
work very well on APRS if I can ever get it on freqency....Thanks again for
the information, I have a feeling I might still be dickering with them if I
had not
mentioned your name...

Who decides which station gets to transmit? I agree with the 30 minute
minimum for intervals, but at that rate even a concentrated area with
every Wx station reporting on 30 meters would use a negligible amount of
the bandwidth.

Rendered body type: text/plain

My sincere appology to N6JLH and those hard working stations that try to
maintain the flow of information to MIR. I did not mean to denegrate
his/their operations one bit. SORRY. Really...

I had meant for my message to address all those other stations who feel
they must try to CONNECT with MIR just to see their DISC-BUSY packet
come back... or those others that are sending LONG UI BRAG BEACONS...

I was only trying to make the point that if all those stations who feel
that they just have to send CONNECT REQUESTS to MIR on every pass would
consider sending a single APRtrak UI posit instead, the total number of
pcakets on the uplink would be LESS and everyone would benefit.

I really hate to see those LONG UI BRAG beacons! Hopefully the 36 hour
or so SPRE mission which has an APRS digipeater on it next week will
allow everyone to see if this mode has advantages over CONNECT REQUESTS
and SAREX numbers...

My apologies to those hardworking AMSAT members that try hard to serve
MIR inspite of all of the useless QRM on the channel...

I have been reading these messages with interest. I for one use my stacked
13B2's many many times. One way is that in order for me to see or communicate
with any of the users in Southern Tennessee i have to use them if i don't i
would never see them at all. Now that ralph N4NEQ installed a great digi
in Western NC i point my beams at it and get extremely good results that i
have never had in the past. Now don't forget N4NEQ is 158 miles from my QTH
and no local digi can hit it directly i don't think. And Bob yes i do change my
PHG each time i move the beams. Of course to give an acurate circle the
figures i enter are way out of line and would tend to show users that i have a
900' tower, but in fact have hit that digi many times with a direct signal from
my qth (158 Miles). So to me my stacked 13B2's are very usefull in using
APRS even if the PHG doesn't fit. And i say YES to the Bob to the rotor
interface HI HI. I agree that beam patterns is to much to ask for, but to ask
for extended figures in the PHG would not. My beams are rated at 18db gain
and with 300+w i have pretty good coverage when needed!. And Bob gosh
this is the first time i have seen you flatly refuse to even consider adding a
feature like a ROTOR INTERFACE to APRS Hi HI (Just kidding Bob).

> attached.

There are three or four GATE stations with good operating practices here in the northern California area. With all the aliasing, I can not tell just who is the actual station doing the gating. If there were a local gating problem, how could I determine the callsign of the gate? Most of our HF GATE stations send out a Vhf bulletin when they are active. This helps but is there a better way? What callsign trail is out there?

now for some local color...

Most of our WIDEs are really wide, so there are <over> five pages of local positions, imagine five or six mobiles at commute sending every couple minutes and a few qso's taking place...we have a busy channel, It still works! Oh I forgot there is a high level low usage bbs on the same frequency...It still works!

OK now every one should look at the Y screen, it is neat to watch the mobiles bounce around the area. Just to add to the PHG confusion I have added /A=000600 to my comments. Bay Area APRS users now see my house at 600' in the Hills. Maybe WIDEs could do the same thing. I have tried to adjust the PHG circle to encompass the typical "mobile" coverage as I have observed it from my station. This is not easy even with a 3 db offset, as I have at least 30 db of hills immiediatly behind me. I don't think anyone in the west has a circular or even semicircular coverage pattern.

I wish the Y screen had a default elevation setting...yea yea yea Oh Sure.

APRS has turned two meter packet into a video game! We love it!

Bob,

You've been doing an excellent job of promoting APRS. Some might even say an excellent job of trying to shove it down everybody's throats.

When Dave Larson N6JLH, who is the authorized Mir QSL manager for North America, says not to send APRS through Mir - I'd much rather listen to him, than _your_ justifications as to why APRS is better, has greater educational value, or is the best thing since sliced bread.

Like it or not APRS is a closed standard - your standard. The only ones who are writing APRS-compatible software are those authorized by the founders (e.g. MacAPRS). And while you may want to encourage its use for every packet application conceivable (see your demo.txt file for examples), it is not your place to encourage its use with Mir or SAREX when the people who are responsible for those activities are not encouraging it - and are discouraging its use.

And while you may talk about 'useless QRM' - one persons signal is another person's noise. Anybody who is 'APRS free' (would that be the politically correct term for somebody who doesn't have a registered copy?) would consider APRS packets to be even more useless QRM.

It also confuses the issue when you are trying to continue to push for something after being informed of its unsuitability - or declare it to be the standard arbitrarily by yourself.

While you may thing that APRS is the best thing ever made - others clearly disagree, because it has *not* been established as something sanctioned by the Mir or SAREX folks.

Let SPRE speak for itself. That's one place where APRS has been authorized as the communications standard of choice, and its success - or not - will help encourage more people on the APRS bandwagon better than any of the lobbying you've been doing.

Just MHO.

BTW - just to set the record straight, I've downloaded both the Mac and PC versions of APRStrack and intend to use them for the SPRE mission where it's been authorized by the principal investigators. But not for Mir or SAREX where it's been clearly discouraged. And will decide whether or not to register after I've determined whether or not it's a program I find useful.

I agree with Gerry's comments about N6JLH's support of the MIR.

He has been instrumental in arranging the transport of a NEW HandiPacket to the MIR to replace the one which had been in orbit for nearly 5 years. (It appeared the memory backup battery had gone flat).

He also helped the delivery arrangements for the German/Russian SAFEX group to do image transfers at 9600 bps (using PacComm SPIRIT-2s).

He speaks Russian, and knows all the people involved. It is so helpful to have someone who knows who to call or where to ship things (and he spends a lot of his own money doing this coordination.)

I personally subscribe to the UI is better than connections group, but there is a lot of inertia and varied goals among the amateur user community. I do hope for a shift in attitude on this issue. The value of one UI frame with a GPS string displayed on (potentially) hundreds or thousands of classroom APRTRACK monitors surely outweighs the value of a DM frame from some guy trying to get a connect with MIR.

I believe in multiculturalism (but am not sure of all the subtleties of the popular definition), and that should apply to ham radio as well. We just have to be tolerant of each other.

Happy New Year to all on the SIG.

Philip,

Take it easy, guy. I found your response to be quite heavy-handed and sounding like a government bureaucrat (Don't bother me with facts, this is our policy....)

I don't really want to get into a shooting match over this, but (IMHO) one self-appointed guardian should not be too rough in calling someone else a self-appointed innovator.

Change can be good!

[This message is not a personal attack. It is a response to your posting.]

At the risk of getting too long again, I'd like to make a couple of points.

1.  The Mir crew, although they have radios and TNCs aboard, are not skilled
ham operators.  They have limited training and understanding of the hobby, and
use it to talk and get messages.  Very mission oriented.

2. When they can't talk or get their messages, they get, well, "unhappy" may
be the wrong term, but it's the best I can think of.

3.  I think that they can and should be queried on this point.  I'll try to
get a message up over the next couple of days to them AND N6JLH about using
Mir as a digi for APRS/APRTrak.

4.  A suggested guideline:  Only one digi in the path: Mir. Not relay,
wide,mir.  Not relay, wide, mir, wide.  Mir.

WB4APR REPLY COMMENT:

True.  That is why I like the recent idea of at least differentiating the
different GATEs between the 10 MHz one and the 40 MHz one.  Hopefully
some local authority out there is discouraging more than one gate per
area per band.  If two gates can hit the same WIDE, then you have
unnecessary duplication of packets.  One of those GATES needs to use a
beam to AVOID hitting that WIDE.

not taken as a personal attack. But since you did post this reply publicly ...

In the eight hours (or so) since I posted the message I received five
responses, including one from Bob, and excluding the person who wondered
what's in my .sig.

Suffice to say that they've all been supportive - including the one from
Bob WB4APR.

No, I have no intention to being a "self-appointed guardian". And I tried
to hold back, but this was just one too many APRS promos I've read. The
others were just somebody stating an opinion and to promote his own product
- which he honestly believes to be a good product. But in this case Bob
was clearly trying to encourage somebody to continue to send APRS packets
to Mir when - according to the sender - the Mir North American QSL manager
has specifically asked that it not be done. I have not personally seen any
message from Dave Larson specifically stating that APRS should not be sent
through Mir, but am assuming that the information is true based on the
information in the post, and that it was not contradicted as incorrect or
false in the reply.

As far as I'm concerned the Mir North American QSL manager outranks me,
Bob, and basically anybody else in this ITU region as far as what should
and shouldn't be done with Mir's packet system.

Unless one of the SAFEX people, or somebody in direct contact with the Mir
radio manager Sergei Samburov RV3DR (manager of all R0MIR activities at NPO
Energia in Kaliningrad) - or any of their authorized representatives -
overrides Dave Larson's request/order/whatever that's what *I* am going to
abide by.

(I also don't attempt multiple SAREX QSOs on a given shuttle mission, don't
transmit FM in the 2 meter OSCAR sub-band, use my seat belt at all times,
and tend to drive on the right side of the road. So sue me - I've got a
couple of good habits.)

No, I am not going to tell anybody else that they shouldn't use Mir as a
pacsat for E-mail, to transmit voice when others are trying to connect via
packet, or not to send APRS packets.

But I am going to complain when somebody else - who is not one of the above
responsible parties - is trying to encourage such an action.

>Change can be good!

Absolutely - but not when it's pushed against the wills of those who are
responsible for making something work properly - that's a revolution.

Like I said before - just MHO.

Yes i seen him also and in fact see him many times. There just is NO way to tell who the local (Closest gate) is. I took Bob's advice and used 1 wide only and it didn't show me anything more then would be shown any other time.
I have been trying to find out who the LOCAL gate to my area is for a year now and whoever it is, is hiding the fact pretty well. Path's in the SouthEast doesn't mean anything because i see them all, including 3 wides and even 3 wides with a relay (You name it and i have seen it). I see digi's 10-15 miles apart and coverage circles that are out of the world. I guess what i'm trying to say it's quikly approacing the state where it's totally out of hand. There is no way i guess to get a handle on this unless the states can get together and come up with a controlling body to handle this sort of thing. The group in Georgia are a great bunch of APRS users but it looks like there are some that are hell bent on going their own way. Well i shouldn't just pick on Georgia i guess (Sorry Ralph). I do have to say Ralph N4NEQ is doing his best to try to have some type of control over all this but there's only so much one person can do when there are so many users in this area. Personally i think there is no room on the network in our area for all those gates (Just my personel oppinion). Specially if there is no way of knowing who is what!.

I am having several intermittent problems as reported via the SIG relayed by JOe KB4FO. I am using the PacComm cable and MFJ1274 with PacComm chip. Computer is Zenith SuperSport 386SX, and Ver 74B.

At first, thought the problem may have been KPC3, but now it appears that this config is also doing it. Review of History when stopped does not show this phenomena.

Path is RELAY, WIDE, GATE, GATE, WIDE

Could it be that the "base" W7LUS-0 was being seen (it is now off) and mistaken for the truck?

Please respond to KB4FO   loewy19@sefl.satelnet.org or via the SIG.

Isn't there a way via appropriate passwords to ensure that only
     amateur nodes connected to the internet can pass messages between one
     another?  Say that node N6xyz-1, a VHF radio with an internet backend,
     will only allow packets shipped via internet from node W2abc-3 to go
     out on the air?  Obviously this requires some prior agreement between
     ops, but that's not a big deal...

Yes, it will be available. But it has the possibility to cause a bunch of
administrative problems. First of all, imagine two active VHF nets linked
via the internet. Then two more, and two more....and there is the problem
of assuring only licensed hams access it...

As I said, my main reason for writing this is to allow me to use the same
TNC by multiple computers, the internet stuff is a nice side effect. Once
MacAPRS is made compatible, I will post it on the TAPR server.

I guess I didn't explain myself well, and maybe it can do this and I don't
know. (RTFM!) Can I beacon the fact that my house hasn't moved on 2m to the
local area, beacon WX to Chicago and Milwaukee areas frequently (I am in
chicago), and beacon WX to the nation once every half hour or so, all with
different paths? If I then want to chat with someone local do I have to
further change one of the above paths so that the Send to path is correct?
Maybe it is the idiot at the keyboard phenomena, but I find changing the
paths cumbersome. Especially when the tnc in question is a Kam+ where there
are separate paths in the tnc, but loaded in with one command.

> > ========================================================================
> >
> >
      Hello, Bill...  The folks at MFJ are trying to make the 8621 Data-only
 radio workable at the APRS frequencies.  First, there are two versions of
 the receiver, and you could possibly have the earlier version that would
 not go higher than about 145.09.  I believe MFJ's method of determining
 the receiver version is by the color of the coil holder that has the slug
 for setting the receive crystal.  My radio was misaligned, and has been

 set by MFJ, and checked by Rick Littlefield, the product designer.
 I haven't checked it out yet, but will really soon.  I believe that Rick
 has suggested a change in the 8621 manual detailing a different method
 for netting the receive crystal.
      The first method they suggest is using a precision signal generator,
 but no details as of yet on this exact procedure.  An alternate signal
 source is a synthesized 2M radio set to low power and use of a dummy
 load.  Yet another method is to use a counter connected to pin 3 of the
 receiver chip, which is a buffered receiver output.  The slug in L4 can
 be set so that the counter is reading 10.7 MHz below the desired
 operating frequncy.  (Counter in MHz = Operating Freq in MHz - 10.7 MHz)
      So, I guess I would be using this last method if mine was not
 aligned by the 'powers at be'.  I'll have to experiment to see how this
 all works.  In any case, I think this will be an improvement over the
 original method published in the manual, as there are several people who
 have had trouble with this procedure.
      Mr. Jim Shurden, KB5JNZ, at MFJ is the contact for any 8621
 problems.  He is very familiar with my radio and is very knowledgeable
 with the new alignment procedure.  I might add that Jim, and his
 predecessor, Brian Bishop, have been extremely helpful with my problem.
      It seems to me that the MFJ 8621 is an extremely good candidate for
 anyone wanting a good, relatively inexpensive, dedicated radio for APRS,
 or other 1200 B or 9600 B Packet operation.  However, I'm still trying
to get mine to 'hear' at the higher frequencies.

To: aprssig@tapr.org
Message-ID: <v01510100ad132c42f818@[128.149.100.84]>
Rendered body type: text/plain

Could someone explain to me why digipeating an AX.25 packet that contains information readable by any system capable of AX.25 packet, and usable by particular software programs known by various permutations of the name "APRS", is somehow fundamentally different than digipeating "hey, this is Joe!!!"?

It is not clear to me that APRS is a different "protocol" than a bunch of people sitting around using unconnected packets to talk. Someone has just automated it a bit and focused the exchanged information in a geographical sense.

I agree that the operators of the space stations such as Mir should have the final say on what is and is not allowed. I think it should either be OK or not OK to digipeat [UI] frames via a particular space station. Limiting what type of UI frame gets through seems artificial (and do not cite TCP/IP, in which a connected protocol "rides atop" unconnected AX.25 [UI] frames. That *is* different.).

Enlighten me.

-Greg

PS Dave, N6JLH, while a truly amazing individual with quite a story, if you can pry it out of him, is the North American Mir QSL Manager. Does that make him the same as a Mir station control operator? If not, any final word should come from them (even if via Dave).

Mr. Chien:

It doesn't really bother me that much what position you take on the APRS/MIR discussion.

What bothers me is the reference in your signature to the last radio communication of the Challenger, and that will cause me to delete any post, unread, that you send to the SIG.

It has taken me a long time to get over that disaster, and I will not subject myself to frivolous reminders of it as used in a very unprofessional email signature.

what is the breakdown on cost?

I like using apr74b.exe!!!!!!!

I want to register.

I want to use it on three computers,  one using just the vanilia functions
(with saving allowed), one using weather functions, and one (portable)
(in car) with the GPS functions.

My call sign is N1MKG.

I'd like to use all the following randomly on each system.....

n1mkg
n1mkg-1
  .
  .
  .
  .
n1mkg-9

(ie sometimes the setup is n1mkg/home  n1mkg-2/gps  n1mkg-4/wx   and
    sometimes the setup is n1mkg-9/home  n1mkg-5/gps  n1mkg-7/wx)

will your validation code system still work?  (ie what I'm asking is
can the validation codes ignore the "-x" part of the entered call sign?)

PS what would be the total cost 24$ plus how many sets of 9$?

PS GPS is a meggelan trailblazer with nmea outputs.

> From: Bob Bruninga <bruninga@nadn.navy.mil>
>
> APR REPLY:  Come on, lighten up.  APRS cant do EVERYTHYING!  APRS already

I agree. It can't and shouldn't try to do everything, or at least
everything does not need to be built in.  However drawing stuff on the
screen, including antenna patterns, is one thing it tries to do.  If you
are going to do it, you might as well do it right.

> supports an offset Pattern with probably a 10 dB front to back ratio..
> which can be oriented in increments of 45 degrees (about the beamwidth of
> such an antenna.

What is the scope and intent? Is everything in there now within the scope
and intent?

> CAUSE MORE PROBLEMS than it would solve.  How many folks would enter a
> NEW PHG each time they MOVED their BEAM????   Then most likely most BEAM

I suspect many would, if they had the facility in the program to do so.
A supporting post by KE4EER he says he changes his even with the current
limitations.
```

> patters would be TOTALLY misleading to mobiles trying to use them.

No more misleading than the existing patterns, I think. These points are only speculation though. There is little point in arguing about different assumptions about what users will do with things that do not exist yet.

> And dont even think of expecting me to add an automatic ROTOR INTERFACE!
>
> hi hi
>

Well, actually this kind of points out what I consider to be a limitation in the way APRS and many other applications that have grown in size and functionality as they matured are implemented as a single program. Well, actually it doesn't kind of point it out, it is an excellent example.

I can only speak for MacAPRS since I have never run the original APRS, but I assume this factor is the same. And even if it is not, when the windoze version becomes the official version they will be the same.

It is generally good software engineering design practice that one program should not try to do everything every possible way with all the choices wired into the code. You can never anticipate the all the ways that users will find to do new and wonderful things.

But, There are many many parameters to APRS, such as PHG, which are obvious natural candidates to be AUTOMATICALLY read from your station equipment and translated into settings for use within APRS. Your APRS position report and/or beacons could automatically reflect the status of your station.

Likewise, it seems obvious that information within APRS could be used to trigger or control other software or hardware in your station.

How can you do this without having to build a new version of APRS everytime someone wants to do something different, or do the same thing with a different piece of hardware? There are a couple of tricks that can be used here to move this functionality out of the hardwired code section of APRS and into the hands of the users.

==

The following is a suggestion provided for your consideration. Food for thought. I am not saying it is the best way or the right way. But you might want to seriously consider if it looks like it would help APRS. I think it is a good fit. But I haven't worked out all the fine details either.

==

First divide APRS into core functions and interfaces.

You have core functions:
   receive and parse a packet
   update parameters
   dispatch functions to interfaces (based on parameters)
   respond to timed events
   respond to user requests
   respond to external events

and various interfaces including:
TNC control interface
map drawing interface
   icon drawing
   antenna pattern drawing
   velocity vector drawing
   df prediction drawing
   balloon prediction drawing
logging interface
object list interface
message interface
list display interface
timer interface
GPS input interface
weather input interface
DF input interface

Now each interface has an "escape mechanism" where an external program (or internal subprogram) can be run in addition to, or in place of, the default interface processing.

If your operating system supports firing up a seperate program as a subprocess, then that would be the most straight forward and flexible way of implementing these escapes (1). The function to process and all current APRS parameters could be written to a temporary file (or piped in, or passed in a message, or accessed through shared memory, or whatever facilities your operating system supports for programs to communicate) The program does its own processing, which may involve measuring or controlling external hardware, or communicating with other software or even other computers, and then writes its results out to a temporary file (or otherwise passes the results back to the main APRS program) and exits. APRS then takes in the commands generated by your program and dispatches them. Or if your program signals that it can not or does not want to handle this particular function with the current parameter settings, then the default interface is invoked.

A system of nearly the same flexability, but more self-contained and simpler to use is an imbedded extention language interpreter. A simple interpereter, which can be called as a subroutine, is built into the main program. The escape code is stored as text which is passed to the interpreter. The interpreter has access to all the APRS parameters. The interpreter would have to implement the ususal arithmetic, string, file access, and control functions, etc, etc, as well as some functions specific to or useful for APRS (such as giving the current time in UTC) and sending commands back to APRS. A large advantage of this system is that features written in "escape code" can immediately be shared with all APRS users since everything is in the same language. An external device communication function must also be included in the interpreter. This could be as simple as testing, reading, and writing bytes to serial and parallel interfaces.

GNU Emacs uses the internal interpreter system, using a simple LISP as the internal language. This is probably the largest, most extended and extensible, most widely distributed and widely used multi-platform program anywhere (multi-platform meaning more than just Mac and PC). It is, of course, free and open. The entire source code, the internal language specification, and all the extensions written in the internal language are free and open.

Now a beam antenna pattern plotter could be implemented very easily as a drawing interface escape. It would read in the station parameters, do whatever kind of calculation it wanted, and pass back to APRS a series of line segements to plot.

Parsing the output from various weather equipment, GPSs, other location montoring systems, Non-gps speed and direction monitors, different kinds of df equipment, controlling stange new types of TNCs, reading or setting the power level from your fancy computer controlled tranceiver, reading or setting your beam antenna direction, triggering different kinds of alarms, poping up maps of specific areas at different times of the day or in response to local or APRS events, using different kinds of df or balloon prediction systems, and lots of other stuff would be natural applications of a custom escape processing mechanism.

I think it would actually make the core APRS program simpler. And it would let others extend APRS without giving up control of the core program, or the APRS on-air protocol. I think this would make APRS more popular. And for Bill, Keith, and Mark, it would make it easier to make custom comercial versions with different fuctionality.

Well, that's the suggestion. Think about. Cheers.

Chuck, ke6cil

Footnotes:

(1) Easiest to implement, however it probably requires the most sophistication from the user. A standard program shell containing a function and parameter parser for input, and a command generator/formatter for output, should be provided as part of the APRS distribution. This program shell would also implement and hide the interprocess communication. This is kind of a problem because users will want to use different languages to implement their escape codes. Every different operating system and language combination will require a different program shell.

>      ops, but that's not a big deal...

Basicly, no.  Passwords will not do it if the password ever has to be sent over
the internet or the radio.  You need a fancy encryption or digital signature/
authentation system.  Keys, except for public keys, must never be transmitted,
unless using an elaborate secure public key distribution protocol.
The internet is a very hostile environment for these kinds of things.

Chuck

Message-ID: <Pine.SUN.3.91.960105171030.3370A-100000@greatlakes>
Rendered body type: text/plain

```
The MIM is a complete TNC (xmt side only) on a chip that sends Telemetry,
Its Beacon text, its APRS Posit (if GPS is conected) and optional CW ID.
Connect it to a transmitter and you have a complete 1200 baud AX.25 packet
telemetry unit.  It has a receiver DCD input for full CSMA if needed.

The first small production run of the prototype MIMs is complete and we
now have an envelope lady and VISA/MC machine, Phone line and address.

     The MIM is currently manufactured by Clement Engineering
                                         PO Box 1086
                                         Severna Pk, MD 21146
     Visa/MC accepted at 410 268-6736  (use 4611 until 15 Jan)
                         FAX 268-4612
```

This MIM does not use surface mount and is 1.5 by 3.25 inches and has a single 21 pin header for external connections. Here are the SPECS:

COST	$89.95 plus about $4 shipping and handling. MD residents add 5%		
POWER	5 or 8-40 VDC	15 Ma	(We are working on a super low) (power mode that will be less than) (0.03 mA between packets)
OUTPUT	AX.25 packet audio PTT Serial Data OUT for Configuration with the MIM.exe program		
INPUTS:	5 analog 0-5 volt telemetry 8 Bits 0/5 volt telemetry 1 Bit Data Carrier Detect (for colision avoidance) NMEA-0183 (and serial data in for configuration with MIM.exe)		
PACKETS:	Each of the following packets can be scheduled at a period of 5 seconds up to 90 hours BEACON TEXT TELEMETRY POSIT (with attached GPS only) CW ID		

The APRS MIM is configured by using the MIM.exe program that makes the MIM look like a TNC using nominal TNC commands for setting the MYCall and other parameters...

We hope to have a larger production run of these full size prototypes in a few weeks. Then we will work on the postage stamp size reduction...

Well ...... not really true. You'll see it if you are close enough to see it direct (from the GATE). An obvious statement, but "you will never see it" is misleading.

What does local mean? I would think it means within the range of a GATE that you can hear.

NW6H in Altadena CA is temporarily a 145.79 "WIDE" using a 3-ele beam pointed generally SSE (my immediate backyard includes a rather large group of mountains about 1 mi higher). From my house I see both the small greater-LA area crowd (8-10 stations) and the much larger (but still small, maybe 15-20 stations) crowd in the San Diego area. I see the other WIDE in San Diego (about 110 mi away). I have a GATE (WB6NGC) about 6 mi from me, and the other GATE is a few miles from the other WIDE. However, both WIDEs can generally see both GATEs due to the layout. So it sounds like the two GATEs ought to use directional antennas to eliminate their chance of hearing the other WIDE and thus reduce interference.

As far as all this purported overuse, abuses and general activity in other parts of the country, it'd sure be nice to see something from somewhere else, but generally it's way quiet out here in LA LA land.

- Jon NW6H

> But APRS, designed to be a distributed NETWORK, in general has no need
> for high gain BEAMS. Maybe I am missing something. What is the value of
> a BEAM when you can hit the local WIDE with 1 watt into a ground plane?

Maybe you are not trying to hit the local WIDE. Maybe you don't have a local WIDE. Maybe your local WIDE can't hear what your want to hear. Why limit the system to what is typical for someone only in an extremely favorable location? We are not talking about what is useful to the guy who lives in a metropolitan area with a digipeater every ten miles. There is no law that distributed "NETWORKS" can not benefit from high gain or directional antennas and therefore must use only omnidirectinal or low gain antennas in all cases.

I see plenty of little "house with a beam antenna" icons when I run APRS here in the San Francisco Bay area. People seeme to be using beams...

Come on, you mean to tell me you can't even imagine one use for beams with APRS? We are not even talking about only high-gain beams, but also just directional antennas, or even just situations where the environment imposes a directional pattern when you use an omnidirectional antenna (just accurately modeling situations that can't be avoided, not everyone lives in the middle of a big plain or the top of the highest local mountain).

Suppose your local WIDE is on the side of a mountain so it radiates only over 180 degrees.

Suppose your house, your remote, or your vehicle is on the side of a mountain.

Suppose you are a long way away from the area you want to monitor or report to and the only way you can reach where you want to go is to use a high gain VHF beam. Say monitoring someone hiking in the wilderness.

Suppose you want to monitor the progress of APRS equiped vehicles only along one long straight stretch of highway which heads off into the digipeater dessert, so you point a beam down the highway from a nearby mountain.

Suppose you want to provide a point-to-point digipeater link (with more bandwidth and less competition than hf) between two networks of APRS stations which can not communicate directly, reliably without beams.

Why do people use beams? Because most of the time, GAIN IS GOOD. Sometimes we just need more gain. Sometimes it is important to not hear anything from some direction, so the directional selectivity of a beam can be just as important as the gain. We can not even begin anticipate all the reasons why beams might be used. It seems unthinkable to me to assume that VHF beams will forever be unimportant to APRS, or anything else.

Chuck

Hear, hear. I like to see the mobiles moving. Boats, trains, trucks,
planes, jeeps, cars, etc. Especially far away. It'd be great if more
HF traffic (up to the physical-law-mandated limit of 11% %^) would
roll through the local gateway, as long as most are position reports.

Boy! I'm kinda envious of the stations that have so much activity on vhf
that the hf gates are flooding them. Here where I am, I dont see any
vhf activity unless there is a good 2M band opening.
I have been listening to 30M just to see what APRS is doing elsewhere
and I enjoy seeing a mobile once in a great while moving on the screen.

I think its pretty much common sense if you are at a QTH, you dont need
to gate your position anywhere. Leave that to the mobiles so we can all
enjoy their travels.

Sure, it would be possible to put some security features into the
program, although have no intention of doing so at this time (as my plan
is for LAN use). It still doesn't solve the volume of linked traffic. One
solution is a special filter program, a layer between MacAPRS and
SerialServer, that filters out all but a few narrowly defined types of
data.

 <Humongous SNIP>

I'm a little confused.  What do you mean by "official" version? I didn't
think WB4APR was writing a windoze version.
I would think any other program that receives and transmits APRS formatted
packets and has a map display would be
a "compatible" version, but certainly not the "official" version.

Or is this dumb Georgia boy missing something?
Maybe I missed it while I was out pouring water on my WX TNC to cool it
down. <g>

WB4APR REPLY COMMENT:

Jump on him with BOTH FEET.  He is doing 2 things wrong.  RELAY should
NEVER follow WIDE in any path, and no one should ever use two GENERIC
hops past a GATE. PERIOD.  If he has a special place he is trying to get his
HF packets to on VHF, then he MUST use GATE,call1,call2,....
```

BUT, when I use the word NEVER, I mean almost never in routine operations. There are always exceptions, but users must understand the extreme QRM NATIONWIDE they are producing whenever they deviate from these guidelines.

WB4APR REPLY COMMENT:

Bill makes a good point. Just like repeaters and packet, coordination is important and an APRS coordinating body with some authority is probably needed in most large APRS LANS. I know I kind'a "rule" in the Balto/DC area, and Im sure that Keith "rules" in New Jersey. Ralph took charge in Georgia and Bill started it all in Alabama. There is the Illinois crowd and I have heared of such organizations in Ohio and Missouri. ITs pure politics, GOOD LUCK! hi hi

My feeling is that any GATE MUST make an effort to ID his station on the VHF side. I will add that to the DOCS...
(APRS wont do it automatically. the owner must monkey around to try to force his TNC to beacon on VHF while he is operating primarily on HF)

Notice, I think this is just fine for W7LUS as he is a full time 18 wheeler driver all over the country. 99% of the time, nobody hears him... but if he gets near ANY APRS station, who has a nearby GATE, he gets picked up, linked to HF and back home back to VHF...

But as soon as we have more than a *few* people doing this, then he may need to back off on the final GATE,WIDE, or set this path for only once every 15 minutes or so...

Apparently my enthusiasm for using APRtrak to plot the locations of satellite ground stations has been interpreted as *encouraging* the use of APRS via MIR. Sorry if it came across that way. I fully respect the need for everyone to use discretion when using MIR, and I thought I always included the disclaimer that I WAS NOT encouraging the use of UI frames via MIR.

My intent was only to suggest to those stations that appear to be SENDING LONG UI FRAMES via mir ANYWAY, to at least consider shortening their brag messages to just their Grid Square so that an APRtrak station can see them on the map. I think if you re-read all of my postings without bias, you will see that is what I meant.

I guess the problem is, that if they take me up on it, then it looks like I have just encouraged another addition to the QRM... Hummh, bummer. *OR* you could interpret each grid-square packet as an accomplishment since it was sent by someone instead of their usual long brag packet... I guess it depends on your point-of-view..

Personally, I hate to see such a precious asset as MIR abused by anyone. I was just trying to suggest a BRIEFER alternative to what seemed to be a significant increase in the number of stations DIGIPEATING via MIR and attempting CONNECTIONS via MIR compounded by a series of recent articles "encouraging" everyone to connect to the MIR BBS and cosmonauts just sort-of because it is there...

Bill,

Will I-PHONE allow "conference" style calls? I have used WEB phone here
(thanks to KN4IM Larry) but it only allows single party , one on one, calls.
BTW it works very,very well for that application. Maybe something like
POW-WOW where we could round table via keyboard to keyboard and "control"
access, IRC can be a zoo.

I think the concept has merit.

I ran Iphone for several weeks here for several hours a day, the program is quite interesting. I had the opportunity to talk up APRS with some fellow amateurs in the Western States and even sent them copies of APRS to try out, great way to "spread the word" since all Iphone users of course own a PC and most are really interested by digital communications.

I was the first to jump on and post the topic APRS (for Hams Only) and found that I got 1 whole phonecall (Ralph N4NEQ!) I keept on runing the topic every day for a few weeks and posted a message on the sig about it but all the other phonecalls I got were from "bevis and butthead fans". A LOT of strange people traverse Iphone and many of them tried the APRS subject, oh well. The for Hams only seemed to help a bit but not totally, got to think of something short but that gets the point across since the subject box will NOT show much more than APRS (for Hams only).

Been busy testing WinAPRS here so I have not been on in a long time but if I see more interest I will make some time and get back on weekends. BTW don't be surprised if you connect to me and get Scanner Audio, I run my 400ch scanner here in the shack 24hrs a day and it goes thru my PC speakers. A side benifit is that it also goes thru my blaster and out over Internet if I am away from the computer.

Rendered body type: text/plain

Ok people we seem to have interest from all portions of the state now except from Jacksonville and the SW area Naples/Ft. Meyers. Please excuse the general reply but I have received over 10 messages about the topic and wanted everyone to get the same reply message so nothing was left out.

General feelings seem that no one is interested in leaving a 24hr gate up or even a 24hr HF beacon for monitoring except for one other person than myself.I guess we can handle that as long as the hours of operation are understood and we can get most people to be there at somewhat the same time give or take. The idea is to compare the printing of positions maybe on a weekly basis either on a HF voice net or on the sig to see if everything is working or if changes are needed to be made.

Step two is to see what hours are good for MOST people, I know that everyone can't be on at the same time so we got to get some idea of what is BEST. The improtant thing is that this is done EVERY DAY, the daily part is the important factor for the test for reliability.

Step three is to make sure everyone has a antenna for the band that hopefully favors the state, if you don't have one start stringing it up. I am planing to do mine this weekend. I have one already but that is also on my 30M dipole that will need to stay on the 30M gate I run. If possible while doing the 40M antenna try to get a 80M dipole strung to the same coax in case we decide to switch to 80M. The 80M frequency may also be a good one to run a APRS Voice net during the test on the weekends.

Let me hear from you on what times you can operate, I will see what the consensus is and let everyone know. Once that is completed I wiill give everyone about a week to get ready and post an exact date to start. By all means get on 40M and work it if you got it before the test. I do know that 7.085 is busy with some Caribian stations on occasion but do not worry too much. They will QSY a bit after they get the hint. Many years ago APRS never did exist on 30M, yes that is correct.. APRS was on 7.085 ONLY! Only after a trip to AL. by WB4APR and a fix to the W3ADO 30M radio did APRS start using 30M as was intended. The frequency did not have that many problems and last year while I ran 40M APRS the traffic on .085 did move again after a few days of heavy APRS operations. They jumped on since we disappeared and left a nice blank hole in a busy band. If our pre-tests show that .085 will not clear up that will still give us time to chose an alternate before the test. Just remember this is not 30M, we will have QRM and more QRN I do not think we will EVER find a totally clear frequency so keep that in mind.

>having to use HF. As an example, WIDEs in Chicago and Milwaukee (90
>miles apart) can't reliably hear each other all the time (not WIDE enough
>- hi hi.)

Beams definetly do have and application for APRS in the above instance. When you get closer to the great lakes :-) and further west those metro area's tend to get spread out and a beam does a nice job of linking them until such a time as the density of full time APRS sites increase's.

If my geography isn't to rusty I think I remember that the population density is greater in the left and right coast's as opposed to the midewest; and I sure as heck have never seen a mountaintop in the midwest. Towers and beams are a definite plus in the great flat lands!

As for getting a better rep of coverage area I find APRS PHG to be a tad conservative but accurate. I twisted the arm of my local communications shop to use their site analysis software, they have great terrian modeling so I get to see all the holes in the coverage.

A good way to get the modeling from them as a freebie is to show them APRS they just go nut's when they see it.

Rendered body type: text/plain

Sat 06-01-96

It got cool here in Minneapolis/St. Paul over night... -20F, or so. Even deep in the heat island it was -10. My U2000 reported the temp correctly, but the data as transmitted and displayed on APRS ver. 7.4c wasn't.. The data was folded about 0F. The *value* was correct (including rounding in the proper direction when below zero), but the minus sign was missing, making it look a LOT warmer than it was. HI!

Just a warning

73, Donn

Well stated, Greg.

APRS is an application. One could call the various conventions of how the
data is used a protocol, but that would be a different meaning of
protocol than that involving UI frames vs virtual circuits.

I have been extremely impressed with the power and flexibility obtained
using UI frames. (In our commercial applications we hardly ever use
connections any longer.) We've learned a thing or two from Bob's
innovations in the use of repeater aliases.

> I agree that the operators of the space stations such as Mir should have
> the final say on what is and is not allowed. I think it should either be OK

> what type of UI frame gets through seems artificial (and do not cite
> TCP/IP, in which a connected protocol "rides atop" unconnected AX.25 [UI]
> frames. That *is* different.).

I was under the impression that ALL UI frames are being discouraged. But
that is the main point Bob is trying to make (with which I heartily
agree): You can do more with less if you use UI frames. Since the 1200
baud MIR channel is a limited resource, we should be looking at 'doing
more with less.'

The primary reason the packet equipment is on the MIR is for the benefit
of the Cosmonauts and visiting Astronauts. They, through their
terrestrial spokesmen, should make the rules. IMHO the secondary purpose
of the equipment should be for benefitting the amateur radio hobby (in
particular) and mankind (in general). Just like SAREX, the more kids you
can get excited and headed into a productive life (hopefully as a radio
amateur) the more successful the work is. (Again IMHO) using the MIR or
SAREX as one more DX or contest object is not what it is all about.

> Enlighten me.
>
```

> -Greg
>
> PS Dave, N6JLH, while a truly amazing individual with quite a story, if you

> should come from them (even if via Dave).

Well, I have only good things to say about Dave. I would presume he feels
strongly about misuse of the MIR packet link and thus is motivated to go
after those he thinks are abusers.

We're back to what Bob said (if a bit indelicately): Understanding the
purpose of doing UIs through the MIR. I cannot speak for Dave's opinion
on this matter, so this is not intended to be putting words in his mouth.

Perhaps UI frames are thought of as only BEACONS by some folk, and
beacons have gotten a bad name in the packet world (somewhat unfairly, I
think.) Maybe everyone just needs to take a fresh look at what their
talking about.

I read the messages about too many WIDES and too frequent beacons in
South Florida. Reminds me of 1983! Same problem then. Some folks just
like to send beacons. And there are guys that like to get on the FM voice
repeater and talk about nothing for hours. Welcome to ham radio.

Back then I advocated a separate frequency just for beaconing. Let guys
see how fancy they can be - how is it any different than RTTY pictures?
If you like that sort of thing, go there. If not, stay away. At least
APRS has its own frequency.

One of the biggest selling factors for packet back when it was quite new
was the idea that we can all share the same frequency since the equipment
and protocol will 'take care of it.' In fact, we had to work to herd
people onto one frequency as they habitually wanted to set up local nets.
But then we were trying to grow from 30 packeteers to 40 in the Tampa
area and we needed more activity. Over the years that message of hanging
in on one frequency has perhaps done more harm than good. Too many people
on 145.01 and it bogs down.

Well, the MIR packet freq bears comparison to 145.01 back when. It is a
limited resource, and in the end, a solution of sharing must be found. If
gentlemanly attitudes prevail, I'm sure a solution can be worked out.
That might be rather noteworthy, but we musn't lose hope.

> of elements you sent me for STS-72/SPREE....HELP.

WB4APR REPLY COMMENT:

Sorry it is not very user friendly yet. For now, use a TEXT editor to change
any two of the existing 9 KEPS in the .orb file to the desired NEW OBJ
numbers. Then either 1) Edit in the keps, or 2) Run APRtrak and tell it
to now update the keps from a file containing the two new ones... Since now
the OBJ numbers will match, it will update...

No, but "one-on-one" discussions can be very helpful & informative. I was
demonstrating I-phone to a skeptic who asked, "yeah, but is their an UNIX
section
on I-phone?"

To my surprise there was a UNIX talk group, and within seconds of me logging
on to the section, we got a call from a med student in Little Rock. My
friend had about a 45 minute chat with him...they both learned something,
and Greg became a believer.

I think it would be quite helpful.

I hear stories like that all the time. I hate to say it but i have talked with many many Amateur radio operators that are letting their equipment collect dust when switching to one of the internet phone systems. Last night i spoke with a ham in NJ and he stated that since using Iphone for the last 6 month's he hasn't used and ham gear at all. Now this is a person that has been a ham for 31 years!. I don't like to see that but it does have a place for an application like i stated before and i have to agree with with Mark and his message below. I know this is a little of topic but i must tell you a story that that the ham told me and swore to be a true store. He was a heavy HF equipment user and one that gave his one neighbor a big dose of TVI. His neighbor approached him one day and told the ham if you promise not to use you ham radio equipment again i will pay for your Internet access every month. He said that he took the neighbor up on his offer and hadn't been on any hamband since. In any case if you are planning to give Iphone a try remember the private topic name is:

That is the least of the problems with APRS and the u-2000...Bob is working on a fix. Until then, it will either work not at all (my experience, with comm overflow errors), or unreliably. Be patient. Bug reports now are not very useful...not until he puts out a version that is "supposed" to work. No current version is supposed to work, so whatever you get is at best, luck. 73,

Well if you can only use your loop and the loop only operates from 10-30 MHz I guess that means you will need to sit it out, not much you can do.

No need to worry though since Dennis for all intents and purposes is at your same QTH as far as HF is concerned, he is willing to help out.

BTW for everyome reading this a GATE is not a necessary piece of equipment, it will just make things easyer. The GATE will cause the frequency to be busyer so that propagation can be better monitored using the VHF packets going out to GATE as a beacon.

This is also one point that I have brought up with one other person. Since it seems that it will be helpful IN THIS SITUATION to have some stations on VHF GATE to HF (not on the 30M net!)I may very well kill my 30M GATE during the tests. I may also do a alias of GATE7 instead on 40M to keep 30M on the air but that will also make sifting thru the traffic difficult. It may be better for all if 30M is shut down for that time, if someone is printed on the screen that means it was either 2M or 40M, no if anr or buts about it!

To those that have expressed a desire to link APRS locations by using the internet might find the following to be of intrest.

```
----------------------------------------------------------------------------
--------------------------------------------------
 AXIP encapsulation daemon.

BY Mike Westerhof KA9WSB, ported to Linux by Ron Atkinson N8FOW.

Description
     A daemon that will allow you to use your linux machine as an AXIP
encapsulating gateway.

Status
     Not properly tested, but assumed to work OK.

System requirements
     KISS TNC, any version of Linux supporting RAW sockets.

Detail
     This daemon is the partner to the IPIP encapsulation daemon. It allows
you to encapsulate AX.25 frames in IP to carry them across the Internet.
This is useful for linking AX.25 networks in remote areas. Ron has supplied
a Makefile for linux, and with it the software  compiled without errors on
my system running a recent version kernel. Ron has also written some README
files which give you the  detail necessary to compile the system and the
original documentation describes how to configure it.

Where and How to obtain it.
     This software is available from

     ftp://sunsite.unc.edu/pub/Linux/apps/ham/ax25ip.tar.gz

Licensing/Copyright etc.
     Freely distributable so long as the original copyright notice is not
removed.

Contributed by:
     Ron Atkinson, N8FOW

This is EXACTLY what I am was talking about earlier with JNOS. I
don't know alot about it but I was told it would work.

I think I can still get the extra Serial Port on our JNOS system,
somebody wanna try it?

I am game.

192. MacAPRS 2.2.0

From: Keith Sproul <ksproul@hardees.Rutgers.EDU>
Date: Sun, 7 Jan 96 22:10:50 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.821070650.ksproul@old-hercules.rutgers.edu>
Rendered body type: text/plain

```
MacAPRS 2.2.0 is FINALLY out!

Both the 68K and PPC versions are up on TAPR..  Come and get it!!!

MacAPRS 2.2.0 has a lot of new features...

*       Full support for the Peet Bros U-2000, including Pressure

*       Better capabilities for switching Unproto-Paths

*       The messages in the MESSAGE window are now able to be SORTED
        You can select which column is sorted by clicking on that column
        at the top of the window. You can sort by:
        - Who FROM
        - Who TO
        - Date/Time msg was RECEIVED    (This is the DEFAULT sort)
        - alphabetic sort by message content.

MAPS!!  Lots of new stuff with MAPS..

*       You can now put PC- MAPS directly into the MAPS folder and
        MacAPRS will recognize them WITHOUT having to convert them first!!
        (Make sure you UN-ZIP them before you put them into the MAPS folder)

*       Map LIST
        This was added because of a 'PROBLEM' with Windoze...  :-(
        In WINDOZE, a MENU can only be as long as the screen is tall.
        i.e. if you have a 14" monitor, you can have so many menu items,
        and if you have a 17" monitor, you can have MORE items!
        Well, some people have LOTS AND LOTS of maps... WinAPRS would support
        this, but you could ONLY select those at the top of the list..
        So, we added a window called MAP LIST, which shows LOTS of info about
        all of the maps.. And, you can double click on a line (map) in this
        window, and it will bring that map up as a NEW map window...

*       I now have a new source of MAP DATA, that I am starting to use..
        With this new data, I can create maps of LITERALLY any place in the
        world!! Look at the following Web Pointers (These will be integrated
        into our normal Web stuff soon)

        http://www-ns.rutgers.edu/~ksproul/APRS/images/Boston.gif
        http://www-ns.rutgers.edu/~ksproul/APRS/images/Florida.gif
        http://www-ns.rutgers.edu/~ksproul/APRS/images/Japan.gif

        PAY CLOSE ATTENTION TO THE YELLOW CITIES!!!

        There is a map made from this data up on TAPR, it is in the MacMaps
        folder and is called   DCW HJ13.map.sit.hqx

        I will be putting more of these maps up soon.. If you have a request
        (especially if it is outside of the US) send me PRIVATE mail,
        Not to the SIG!! and I will see what I can do..

        NOTE!!!  These new maps are FULLY backward compatible, even though
        they have new stuff in them, AND they are fully compatible with
        WinAPRS!!
        (WinAPRS won't show the filled in yellow cities, at least for now)

        The fact that we can do this good of maps for the entire world
        now opens APRS up to a lot more people!

        I have played with maps in Europe, Australia, New Zealand, and
        Russia, and they are GOOD maps!!!
```

* Auto Configuration of Map Windows..
If you have a set of maps that you like to have come up every time you start the program, do the following.
Rename each of the starting with a number (In NUMERIC ORDER of how you want them to appear) i.e.

1.usa.map
2.Mid Atlantic.map
3.New Jersey.map
4.MyLocal.Map

Put these maps in the TOP level of the MAPS folder (not in a sub-folder), and MacAPRS will load them in the order specified.
The ONLY limitation to how many maps you can do this way is how much memory you have...

Also, after the program is running, you can RE-DO this, if you close ALL windows, and select AUTO CONFIG MAP WINDOWS from the WINDOWS Menu..

* Page-Up, Page-Down (and +/-) do zoom-in, zoom-out.
Home and 'H' do HOME map (CMD-H does this too)

193. Unofficial Start on 3.585 LSB

From: n2czf@gate.net
Date: Sun, 7 Jan 1996 22:37:28 -0500
To: aprssig@tapr.org
Cc: kheyboer@pinegov.co.pinellas.fl.us
Message-ID: <199601080337.WAA26826@osceola.gate.net>
Rendered body type: text/plain

Well after a severe cold front moved in Sunday afteron I had no other choice than to start on some other band than 30M. While I was on the roof connecting the coax to my 80/40M dipole the front moved in and allmost took me off the roof with 30+ MPH winds and higher gusts. At that same time I saw my 1yr old 30M dipole that survived a noreaster and hurricane come down right before my very eyes while on the roof.

I tried loading the new fan doublet up on 30M and it works but at a max power of 50W or less if I do not want RFI on my TX audio. BTW a couple of others have this problem, everyone that may suspect some SWR problems please check your TX audio for RFI!! After the RTTY Roundup I moved ot 7.085 and could not raise a soul but then I moved to KD4UYR's suggested 3.585 and saw WA6RTX in Orlando runing Lan-Link listening in on the frequency. Soon after KD4UYR poped in with a good signal and faded out. KN4HX got on from Ft. Laurderdale and had a good signal also and then N4YFV got on frm Ft. Walton Beach and I introduced him to APRS. He just heard us making a bunch of racket and connected.

Anyone who can get on please do so and start geting aquainted with the the band and start zero beating everyone so se can all be on the same frequency. No need to take notes or save special backup files yet, I want everyone that is going to participate to have time to get a antenna up or repaired and have time to prepare to be on regularly.

BTW to all others on the sig thanks for puting up with these messages. I am currently looking for software so I can e-mail EVERYONE directly that is participating. We have about 6 on the internet that are involved so the CC and BCC just don't cut it. If anyone has suggestions I would appreciate it. I want to be able to enter a message and then using on "address" or command send out copies of the message to several people. Kind of what this APRS sig does but on a smaller level. Once I find that I will not need to send all this mail to the whole sig.

194. SPRE guidance

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 7 Jan 1996 23:53:28 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960107233231.8432A-100000@greatlakes>
Rendered body type: text/plain

Im sending this to APRSSIG first. If anyone sees any poblems in it, lets get them corrected before I send this out to AMSAT-BB...

APRtrak summary for the SPRE mission:

MISSION SUMMARY: The SPRE will be deployed in a few days (11 Jan launch) from the Space Shuttle for about 46 hours and then retrieved. (14-15th) WHile it is free-flying, it will be transmitting its GPS posit and a few channels of telemetry using standard 1200 baud AX.25 but NOT in the standard APRS format. The SPRE TNC (W3EAX) will also be available to digipeat GRID SQUARE posits from groundstations on 145.55 MHz.

GRID SQUARE FORMAT: Stations without APRtrak or APRS may simply place their 6 digit GRID SQUARE in the TO address of their TNC and transmit a UI frame via W3EAX. This is done by using the TNC command UNPROTO GGGGGG VIA W3EAX. If you don't know your 6 digits, use GGGGAA. Now put your TNC in CONVERSE and each time you hit a CARRIAGE RETURN, you will trasnmit a GRID SQUARE packet of minimum length. Or you may set your BEACON to every 10 seconds or so using the BEACON EVERY command. (This will not work on many TNC's that always send their BEACON to the address of BEACON instead of whats in the UNPROTO command). If you use the BEACON, PLEASE make your BText as SHORT as possible. Anything longer than "Hi!" is wasting bandwidth.

USING APRtrak: APRtrak is a significantly modified version of APRS that will parse the special SPRE posits and telemetry. Be sure you have version 0.5. APRtrak, like APRS, has a special SPACE mode that will automatically transmit your GRID-SQUARE posit and will display all such packets received on the map.

DIFFERENCES BETWEEN APRtrak and APRS:
- APRtrak was donated to the AMSAT software library. Register with AMSAT.
- APRtrak plots the movements of up to 9 satellites using KEPS.
- APRtrak ignores most terrestrial APRS posits by ignoring all packets that use MORE than one digipeater in their path.
- APRtrak will decode the SPRE position and TELEMETRY. APRS will not.
- Both have SPACE mode. (alt-SETUP-MODES-SPACE) which:
  - automatically inserts your GRID-SQUARE in your transmitted POSIT.
  - THe period between each POSIT doubles after each transmission to minimize QRM for un-attended stations
  - If the SPACE DIGIPEATER is heard, then the POSIT period is reset back to a minimum value.
  - If your OWN digipeated packet is SEEN on the downllink, then your POSIT period is FORCED to 9 minutes and a CONGRATULATIONS message is displayed!
  - APRtrak places the TNC in MCOM ON. This way it will not only display all packets, but this mode also enables the automatic LOGGING of ALL packets.

OPERATIONS: Be sure to PRACTICE before the SPRE mission. APRtrak and APRS are a totally different approach to packet and take some getting used to... Although you may find some APRS activity on your local area APRS frequency (try 145.79) remember that APRtrak will ignore APRS packets using more than one DIGIpeater. Use the OPS-UNPROTO command to enter the call of the local digipeater; then practice... Find someone else that is in range of the same digi and see if you can see his posit.

Another way to practice is to tune in 145.55 and monitor MIR. DO NOT SET SPACE mode however, UI packets are NOT desired via MIR. Without SPACE mode you will only transmit a packet about once every 10 minutes. If you want to be sure that you dont transmit to MIR, toggle your xmter off using the CONTROLS-XMT command.

TROUBLES: APRtrak tries to properly configure your TNC, but the manufacturers all have different command sets. Be sure to set up your TNC for 9600,N,8,1. If you see garble packets, check your manual and be sure to use the proper PARity command to set for NO parity. To talk to your TNC while APRtrak is running, use the OPS-COMM command. (Experienced APRS users should be careful to NOT hit O-C-T out of habit, because that will place your TNC into TRANSPARENT mode!)

SPRE SET UP: Although APRtrak will decode the raw telemetry values for SPRE, it needs to have the SPRE telemetry equations loaded before it can display the proper engineering units. Use the FILES-LOAD command to load the file SPRE.BK. (or it might be W3EAX.BK) Im snowed in today without a copy of APRtrak to confirm any of this. Watch the AMSAT-BB for any updates to this file...

ANother big problem is that some TNC's monitor their OWN outgoing packets even if they are NOT digipeated. This will automatically give you the CONGRATULATINS message and cancel further transmitting EVERY time you transmit a single packet in SPACE mode. Be sure that MXMIT or whatever is the command on your TNC is OFF. If your radio echos the XMT audio back in to the TNC, this problem will also occur. If you cannot get rid of your own packets, then disable SPACE mode but be sure that GRID-TO is enabled. I think this is on the CONTROLS menu somewhere. You can still force your POSIT or BEACON to go out every now and then using the XMT-POSIT command.

BEACON TEXT. In APRS or APRtrak, your default BEACON will be your software version number. That is a WASTE of valuable bandwidth. Be sure to change it to something SHORT and meaningful using the alt-BEACON command. Mine will probably say "Hi! de Bob" or something like that.
NO NEED TO SAY your call, or your location, Thats already in the packet.

---

195. Florida 40/80 m gates

Message-ID: <Pine.SUN.3.91.960107235444.8432B-100000@greatlakes>
Rendered body type: text/plain

WB4APR REPLY COMMENT:

Why will GATE7 make shifting through the traffic difficult? I think it is the only safe way to do your test. I completely agree with your planed experiment, but *please* do not encourage the VHF ers to use GATE. All it will take is one 30M gateway that doesnt shift somewhere in Florida, and 30m will be killed. Pse tell the VHFers to go VIA GATE7 or GATEL so that these packets cannot get to 30M. No one knows where the GATES are for sure... Just ask Bill, hi hi

196. KPC-3 State Machine DCD ??

From: Pete Baston <pete@bearnet.demon.co.uk>
Date: Sun, 7 Jan 1996 22:32:37 +0000
To: aprssig@tapr.org
Message-ID: <GeWT1DAFoE8wEwZA@bearnet.demon.co.uk>
Rendered body type: text/plain

Hi All

I am considering a small, low power, TNC for use as a GPS tracker. A couple of people have suggested the KPC-3 but I have one question about it's DCD. Does it have, or have the option for, "State Machine" type DCD, allowing the radio to be operated with squelch open ?

Both my current TNC's are a UK designed TNC-2 klone. They both operate much better without having to rely on the radio's squelch.

What is the best TNC for this application ?

Cheers - Pete.

IS there anyone operating on 17 meters as a gateway.
Would like to establish something there.

Is there a freq that has been chosen,

Thanks in advance...
Mike

Hi Pete,

There is 3 squelch settings for the DCD. You can use the normal mode (radio
squelch), you can wire an external squelch line, or you can have the software
detect a valid carrier, so you can run with open squelch. Most Kenwood mobiles
have audio on the mic connector, and it is not squelched, so you need to set
the KPC3 to the "software" mode. This seems to be the perferred method.

cheers...mike

Yes, you can easily set the Kantronics TNCs to operate with open squelch.
The command is CD SOFTWARE.
Having tried both the PacComm Tiny-2 MkII and Kantronics KPC-3 I prefer
the KPC-3 for tracker operation.

Barry,

I don't think that will help because many hf signals come in with GATE,WIDE
on them. Both gates then pick them up on hf, send (gate) them to vhf, then
with a WIDE yet go, are picked up from each gate by the same wide(s). What
we need to do is to physically separate the gates more so that they don't
get into the same wides, or to move one gate to another hf band so that it
is picking up different information. I have been trying to contact N9VHW
Jerry to talk about this, but he must be out of town. I don't mind moving my
gate, but don't want to do it without coordinating with Jerry that he is
willing to stay on 30m for a while.

My vision of the ideal is both. The reason is because the chicago area is so
big, that a single gate location cannot hit wides that are far north or far
south. Unless that gate location has very good coverage. In fact, Jerry has
the better of our two locations for trying that. Also with the ideas lately
of trying to use other hf bands for other APRS type information, I would
like to try 40m or 80m.

What do you think?

Rendered body type: text/plain

The ideal solution would be that the GATE is also the WIDE, and so
there is not another radio link hop to further congest the airwaves.
However, given that the TNC firmware right now doesn't allow for that
and that the colocation of GATEs and WIDEs is rare, I guess that a
GATE should really use a narrow beam to aim directly at the WIDE.
Better yet would be to use another frequency to handle the GATE-WIDE
traffic.

THe WIDE is also the LAN hub, and as such should seamlessly provide
the gateway function to other LANs. While NW6H is the current WIDE
for the LA area, I am not the GATE (bad geography for north and east
looking HF traffic). I have heard rumors that others in the LA/SD
area are working on a new WIDE for LA, and that it will truly be a
high-level location. Maybe even with HF capability?

205. Re: KPC-3 State Machine DCD ??

From: kc5ejk@onramp.net (Robert Winingham)
Date: Mon, 8 Jan 1996 12:58:58 -0600
To: aprssig@tapr.org
Message-ID: <v02130500ad1716383504@[199.1.11.109]>
Rendered body type: text/plain

The KPC-3 does a software version of a State Machine DCD.
Several other TNC use a true hardware State Machine DCD. Example the
PK-96. The hardware State Machine DCD is faster but I don't
know if that makes it better or able to get those weak stations.

I have both a KPC-3 and a AEA PK-96 and now that GPS firmware is
available for the PK-96 I plan to do a test of both.

I put the KPC-3 a bit ahead of the PK-12/PK-96 for portable use.
(uses less power,DB-9 plug for radio,)

The bad think about portable use is you have to fiddle with the
vol. knob on the radio/HT if you don't have a packet port.

```
WB4APR REPLY COMMENT:

Yes, it has software DCD.  But draws about 25 mA I think with the LEDS
off..  You might consider the new MIM module which not only sends the GPS
posit but also 5 Analog telemetry values and 8 single BIT values.  It only
draws 15 mA and for extended low power applications, a later version
will go to  sleep between posits and draw less than 0.05 mA.  But it only
has an envelope DCD.  Cost is about $89.  OOps, it also only permits a
single (1) digipeater hop for now.

The optional MIM module could power up the GPS once a day, get a fix, and
then beacon its posit once an hour for a year on a set of D cells.

I am starting to put map files up on TAPR in ZIP format. This is because it
is VERY easy for the Macintosh to understand ZIP files, but not so easy for
PCs to understand Stuffit files.

I have also uploaded the latest version of ZIPIT for the Macintosh into the
folder  /tapr/SIG/aprssig/upload/MacMisc/

At the moment, I am putting these map files into a directory called
WinMacMaps.

Unless I hear some complaints, I will start doing all maps via the ZIP file
format.

This is an idea. What you are hitting on here is a fundamental problem with
aprs in a mature area. That is the problem that was discussed a while ago
about digipeats "going in orbit" with WIDE and RELAY stations. This is of
course the transient users dilemma, how to determine a path in an unfamiliar
area. Furthermore, not every transient has the ability to communicate with
his tnc, ie: if he is in tracker mode.

Perhaps several things need to be done, one of which is your idea of
presenting this info to those interested. Whether or not we should be
encouraging pbbs activity I will leave to the others on the sig to comment.
Keep the ideas flowing!

Rendered body type: text/plain

I have a pk232mbx with the aprs eprom. I use pkgold 386 as my
regular tnc program. I have configured the program to exit in the
command mode. I also have renamed the aprs74e initaea program to
shutdown.tnc and have used that as the shutdown tnc file program.
The baud rate on start of aprs74e has been entered as 9600 which is the
baud rate that is used by pkgold.
        The program still says it is not communicating with the tnc.
The computer is a pentium 90 with the fast uart serial chip. The serial
port com1 works fine with pkgold.
        If anyone has the proper shutdown file for the pk232 + pkgold,
please email a copy to me. Any other suggestions would be greatly
appreciated.
      Thanking you in advance. Gene N2OBW

John (and others),

While I can appreciate your sentiment, I believe your concerns are seriously
misplaced.

Phil has been and continues to be a serious supporter of the US (and
international) space program(s) as well as ham radio efforts in space. He's
very knowledgable of the intricacies of the program as well as the superficial
niceties.

I, for one, never thought twice about his .sig addition.

I've spent more than my share of time in the Mission Control Center at NASA/JSC in support of SAREX, as well as the Payload Operations Control Center in support of a couple of other experiments. To this day, the "Go at throttle-up" call is retained. It's a major checkpoint in the Ascent phase of every mission. And, yes, everyone I know now holds their breath for the period from throttle-back to throttle-up plus about 15 seconds... and looks at monitors or data displays, as appropriate, praying we won't see it again.

Phil, correct me if I'm wrong. I never thought that was a Challenger reference. I guess I'm naive.

Regards, Gerry

Well with the propagation that we have here and the series of digi's traffic is very heavy as you probably can expect. With the GATE off it will be much easyer to see what is coming from where considering I run 2 PC's anyway now 1 on VHF and 1 on HF.

The other reason I was not suggesting to GATE was due to the 30M problem possibility. We have already settled on FLGATE as the appropriate ALIAS and it is in operation as I type this. Map is full of KD4UYR's WX warnings and the forcast. Temp predicted to be BELOW 20 deg!!! from N Orlando to the North and well into the low 20's in my area here near West Palm Beach.

I know you guys have it bad but we do also, I can't think of what the "Crackers" (native Floridians) are going thru right now! I am cold myself and a native of Bean Town.

Rendered body type: text/plain

We are currently testing the 80 M statewide net concept in here in Florida and we are having some successes between West Palm Beach and the Tampa Bay area...

Our gates are entitled FLGATE to avoid unintentional transmission onto the 30 meter side....we are ENCOURAGING users within range to set UNPROTO to FLGATE,FLGATE,WIDE but DO NOT use generic WIDE so as not to QRM 30 or even 40 M nets.

I hope to establish Gateways in key cities and still maintain at least one on 30 M so we can keep contact with the US as well.

The frequency for HF users is 3585 LSB...zero beat to either N2CZF or KD4UYR...

73 and keep APRSing!

de Kevin KD4UYR in freezing Florida (forecast 24 degrees tommorrow AM)

>Keep the ideas flowing!
>Paul, WD9ABE
>Maybe closer to GLNTC than anybody (5 miles)

Around here, occasional TNC PBBS activity is not discouraged, especially if it is done without digipeating. A one-hop digi connect isn't too evil either. Still, we don't see too much. There was a small group of stations in my immediate area who were on APRS all the time, and TNC maildrops were used from time to time. Most don't have their APRS stations up any more.

But for this application, even with its potential usefulness, I would not expect to see a significant impact on channel congestion.

Jack

Message-ID: <199601090109.UAA44196@osceola.gate.net>
Rendered body type: text/plain

Well be advised that we are trying what some call NVIS techniques with very low dipoles "a la military". I am at about 25 feet maybe 30 and others are at about 30ft.

I would say KD4UYR and myself are going to be the standards since we are on 24hrs a day with less chance of frequency drift. My exact frequency with a PK-900 AEA TONES is 3.585.42 LSB. The reason we are on .585.42 ??? well when we first got on we had to do a bit of hunting to find 2-3 stations and we never bothered to change. Nothing official (record keeping) has started yet so it is no big deal, we will probably drift to 3.585.00 once we start.

Well guys attempted to go the direct route trying to find out who the local gate is by posting a bulletin asking, but of course didn't get any replys as i knew i wouldn't. This may not be the way to do it bit it's the only way i know.
I proceed to set APRS with a path of WIDE,GATE,GATE,WIDE set APRS on HF and went to bed to take a well earned nap, several hours later the gate had been shut down. Now all you HF Gate users go ahead and come at me with the flame throwers but if nobody can come up with a better way to find out who the gate is that is trying to drive me crazy then this is what i will be doing from now on. So hopefully the person that insist on having his gate on 100% of the time now will read this and start being reasonable. I feel i have the right to do this simple due to the fact that my coordination papers simple say for packet activity and nothing about beaconing to HF trough a local Gate that of course isn't coordinated. Ok guys let it fly. I have received many messages to my e-mail address supporting my effors to slow down the abuse from those gate users. And by the way this abuse is being transmitted over several states, not just in my area.

You possibly have PKGold configured to leave the TNC in HOST mode instead
of COMMAND mode when you exit. Type ALT-S, then look at the
Communications parameters. Make sure PkGold exits with the TNC in
COMMAND mode.

Sent: Monday, January 08, 1996 12:32 PM
To: aprssig@tapr.org
Subject: [APRSSIG:5830] HELP PK232 +APRS

I have a pk232mbx with the aprs eprom. I use pkgold 386 as my
regular tnc program. I have configured the program to exit in the
command mode. I also have renamed the aprs74e initaea program to
shutdown.tnc and have used that as the shutdown tnc file program.
The baud rate on start of aprs74e has been entered as 9600 which is the
baud rate that is used by pkgold.
The program still says it is not communicating with the tnc.
The computer is a pentium 90 with the fast uart serial chip. The serial
port com1 works fine with pkgold.
If anyone has the proper shutdown file for the pk232 + pkgold,
please email a copy to me. Any other suggestions would be greatly
appreciated.
Thanking you in advance. Gene N2OBW

> and it is in operation as I type this.

WB4APR REPLY COMMENT:

As I had suggested in all three of my earlier messages on the subject, I
would prefer that you put the optional GATE designation as a suffix,
IE GATEFL; instead of a prefix. That way the suffix can be 1 or 2
characters and is still easy to parse due to the leading GATE....

I know it doesnt make a difference now, but once things get rolling, it
is harder to change it later... If you prefer FLGATE stongly, I can of
course work around it....

Ah, if it were only so simple... just toss in a few security features...
Hey, why not go into the digital cash buisness since verifying the identity
of someone over the internet is so easy? :-)

You must remember a few things about the internet and computer network
security in general. Anything you send can go to lots of places besides
were you want it to go. It is a lot like transmitting radio in that
sense. Lots of people can see everthing you send. Thus no password stays
secret long. Even if you send your password encrypted, what is to stop
someone from recording the encrypted version and playing it back?

If you want make use of the internet with APRS in an interesting way, let
me suggest that you do not impose all the limits of 1200 baud VHF packet
radio onto the internet. Relaying VHF packets is useful, but it is about
the least useful use of the internet/APRS that I can think of. It would
be so much better use of the internet's facilities to do something like
send position reports to a central or regional host on the internet. That
host keeps a data base of each submitter's last known position. A
subscriber can then send a request to the internet host, which returns,
via the internet a list of everyone's last known position in one quick
message. When a submitter sends in a new position (which indicates an
actual change in position), the host could send out updates, via the
internet, to interested subscribers. (The host would have some policy
about the volume and rate of outgoing messages.)

The whole thing could be done with e-mail, a mailing list package,
a few simple programs, and a spare host on the internet.

APRSM@APRS.NET anyone?

Hey, you don't even need a radio or license to join the fun!

Message-ID: <9601082358.AA53200@oscar.telalink.net>
Rendered body type: text/plain

Bill,

I downloaded your almaps07.zip and almaps05.zip files and neither one
contained the Tennessee (or Nashville) maps that you described in the map
lists. Could you e-mail to me or upload those maps on TAPR.

I am also interested in a map that is centered on Lat 35degN Lon 86degW and a
radius of about 20 miles with as much detail as possible. i will be using it
on a Mac so the 3000 point limit is not a factor for me (it still may be one
for you).

Any hints on ordering CD-ROMs. I plan to order the #5 and #6 CDs Both in
1:100,000 and 1:2,000,000. Do any of these include elevation data?

Thanks,

Bruce

I suppose an encryption/autentication package such as PGP could solve
this problem. As long as the encryption/decryption are done at the
Internet gateways, there should be no problems using encryption even
though part of the link takes place on the air.

Kantronics has come out with a firmware version 8.0p which does just
that plus added TOR mode in which an hf station can connect to your
tnc by using any of the TOR modes, AMTOR, PACTOR or GTOR and the unit
will now detect the mode and lock on to the signal without computer
assistance. It is well worth the 24.95 for the upgrade chip. It
handles all of the GPS command very nicely...73 and have fun

I don't think PGP has been shown to be really secure. It was designed
to be effective in the average case when you don't have a lot of
resources to spend to break it (thus the name). Even if it is real
secure, it must be used carefully to preserve that security. I believe
PGP would still be subject to playback of previous messages by
unauthorized parties, unless additional measures were taken.
Encryption usually must be done end-to-end not at intermediate
gateways, otherwise the gateways must be trusted and are thus subject
to attacks or impersonations. Making part of the link on-the-air is
the least of the problems.

The existing security is probably good enough for most people, but the
problem in the USA is a legal one, not a practical one. The problem is
that the FCC requires that amateur radio transmissions be controlled
only by licensed amateur radio operators. Transmitting in response to
a packet coming in over the internet is not allowed, because the
transmiter can not verity that the internet packet was originated by a
licensed radio amateur.

Similarly automatic internet to amateur radio mail gateways are not allowed. Each message must be forwarded manually by a licensed operator who then is responsible for the legality of the message (including content restrictions). There are no restrictions going the other way, amateur radio to internet.

4.1 SPRE Passes

Before setting up any equipment it is important to determine if SPRE will fly within range of your location. If it does, the quality of the passes needs to be considered. To make this assessment, first look at a map and determine the latitude (degrees North or South of the equator) in which your station is located.

If your latitude is greater than 43 degrees, your chances are hearing or relaying through SPRE are zero.

If your latitude is between 40 and 43 40 degrees, your chances are hearing SPRE are very poor. Your chances of relaying a signal through SPRE are about zero.

If your latitude is between 35 and 40 degrees, your chances are hearing SPRE are very good. Your chances of relaying a signal through SPRE are poor without a well equipped HAM radio satellite station.

If your latitude is less than 35 degrees your chances of hearing SPRE are excellent. Your chances of relaying a signal through SPRE are good with modest equipment if there is not much competition on the uplink.

Latitude	Hearing SPRE	Relaying Through SPRE
> 43	No Chance!	No Chance!
40 - 43	Poor	Very Poor
35 - 40	Very Good	Poor
< 35	Excellent	Good

If this is the reason, then IMHO, the MIR station should disable it's DIGI function. If you are going to talk to MIR, talk to MIR, don't use MIR as a reflector to talk to someone else in real time. Once this is done and people know about it, the casual use and QRM should drop off unless, of course, everyone just shifts over to try to use MIR BBS. DIGI of connected packets is such a bandwidth hog that unless I'm running APRS, I normally disable DIGI to discorage it's use.

237. Re: [APRSSIG:5753] Clueless question

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Tue, 9 Jan 1996 09:05:26 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <199601091505.JAA24025@solar.cs.tamu.edu>
Rendered body type: text/plain

Gregory R. LaBorde sez:

> Could someone explain to me why digipeating an AX.25 packet that contains information readable by any system capable of AX.25 packet, and usable by particular software programs known by various permutations of the name "APRS", is somehow fundamentally different than digipeating "hey, this is Joe!!!"?

When Mir was new, and the earth's crust was still cooling, and shortly after the radio went up in a box marked "Cake," a lot of folks learned about the digi capabilities of Mir. It got pretty bad. Some passes, the cosmonauts couldn't make a voice contact over CONUS because of the packet racket. With a few well-placed messages, and a bit of harping on the worst offenders, and a healthy dose of tincture of time, most of the random digipeating died off, and the guys could expeect to either do packet or voice as *THEY* deemed desirable. About a year ago, Dave was trying to support the guys up there, and had some problems. He saw some form of gibberish he couldn't interpret and shipped a copy to me. The timestamps indicated very, VERY frequent attempts to ship position reports through. He asked then that it ease off or cease. Now, my timing's not too good this morning... it could have ben longer than that, but you get the idea.

Another thing that had to be squelched in that period: A lot of folks decided to start using Mir's PMS for worldwide mail. The Mir crew, directly, and via AMSAT, requested in strong terms that that cease, and only mail to Mir, or from Mir to selected folks (their dynamic selection, I might add) be posted. Not unreasonable as a request, since for a while a lot of their daily operational message had to go up that way a coouple of years ago (and not a violation of any laws: without the messages, they were in an emergency setting!)

> It is not clear to me that APRS is a different "protocol" than a bunch of people sitting around using unconnected packets to talk. Someone has just automated it a bit and focused the exchanged information in a geographical sense.

That it doesn't make sense to the uninitiated, makes it seem to them like another protocol. It's a code, although an open one, in the strictest sense of the word.

> I agree that the operators of the space stations such as Mir should have the final say on what is and is not allowed. I think it should either be OK or not OK to digipeat [UI] frames via a particular space station. Limiting what type of UI frame gets through seems artificial (and do not cite TCP/IP, in which a connected protocol "rides atop" unconnected AX.25 [UI] frames. That *is* different.).

Indeed. I'm pretty certain that the concern is a high rate of position reports.

> PS Dave, N6JLH, while a truly amazing individual with quite a story, if you can pry it out of him, is the North American Mir QSL Manager. Does that make him the same as a Mir station control operator? If not, any final word should come from them (even if via Dave).

Indeed, again. And, ask him sometime about Norm Thaggard and Mother's Day.
:-) *That* is a heartwarming story!

Again, and to summarize: It's the frequency of the unproto digipeats that can
cause the problems. And it's not just APRS. I'd be much more worried by a 10
sec. beacon frequency with a long beacon text than by an every 2-minute APRS
beacon.

Nope. And folks have been working on this for years. Possibly with the
advent of IPV6, header authentication and encryptions with public and private
keys (in a manner considerably more robust than RSA) we will be able to do
tunnelling of protocols more smoothly. I do know KA9Q has a real interest in
this and is in the thick of the IP Security working group concerning that.

Offhand, I like Chuck's idea, but I won't have time to do anything with it
'til after the cows go out again.

To borrow a Blues Brothers line...

I didn't do it. It wasn't my fault. It was terrible. A flood. Of locusts.
believe me, baby...

:-)

Just recall that most missions, unless they have a mission requirement for a
higher inclination, will take the lower energy launch to 28.5 degrees, using
the earth's rotation for a few extra KPS. So, I suspect that is what happened
here.

>Bill, KE4EER asks "Just a question is RELAY,WIDE,GATE,GATE, >WIDE be
something I should be using?".

Bill, you've been using APRS long enough to know better. For those who don't,
the above digi path can be used for mobile units. For OPTIMUM utilization
over HF however, I set my KPC-3 to digi through this path at once ever 10
MINUTES. Also, another path set to WIDE,GATE,GATE,WIDE is set at 11 MINUTES.

The path referred to by Bill is not recommended for a base station, or if you
leave your GPS/APRS mobile on 24 hours a day and are only driving across your
own town/city, and especially not digi'ing out once per minute, like some
users apparently have been.

Folks (and I think Bill knows this), we all need to use a little common sense
when coming up with a path that includes the HF bands, irregardless of the
freq. 300 baud is slow, and the limitation of some TNCs to set multiple digi
paths is interfering with those on VHF and trying to get position updates
once a minute into their community. If you only have once digi path, and want
to set it to once a minute, keep your signal to VHF only. If you have the
capability of the KPC-3 and multiple digi paths, I don't see a problem with
setting one of them to WIDE,GATE,GATE,WIDE or RELAY,WIDE,GATE,GATE,WIDE as
long as your rate is 10 minutes or MORE.

I don't need the flak or flames here. No fire protection whatsoever. I do
however have a bathing suit, and with that I'll say....... TIME TO HEAD TO
THE BEACH.

Aloha, Dave.

```
Chuck appears to have a far better understanding than most of us of
     the security (and lack thereof) issues that surround the Internet.
     His points are well considered.

     However, I'd like everyone to consider this: this is Amateur Radio.
     Not banking, not NSA secret data, not private personal communications.
     By its very nature, Amateur Radio carries no information of "value".
```

There are no secrets. It is a giant party line, where anyone in the world may tune in and monitor. (Sounds like the Internet, huh?)

It is true that Amateur Radio transmitters may be operated only be licensed Amateurs. The intent of the rule is clear. However, there is no way to guarantee that this will always occur. A repeater, remote base or packet digipeater, for example, is in truth a fair portion of the time unmonitored and therefore open to keyup by an unauthorized or perhaps unlicensed individual. The FCC recognizes this and requires due diligence on the part of the control operators or licensees. However, it's not possible to make sure that it never occurs.

There are autopatches sold and used that allow an outside caller to call in and cause the Amateur Radio transmitter to come on, ID and transmit a ring tone. These are quasi-legal but tolerated by the FCC so long as there is no egregious violation of the rules. The point here is that there is already precedent for the control of an Amateur Radio station from a wireline common carrier.

The Internet is no different. In fact, it can be argued that the Internet is merely a protocol that lays atop the telephone common carrier service. Thus, so long as Amateurs exercise reasonable and prudent control of that interface, and do not allow any "misuse" to get out of hand, that it should be tolerated by the FCC. Section 97.219 - Message forwarding system, states

> (d) For stations participating in a message forwarding system, the control operator of the first forwarding station must:
> (1) Authenticate the identity of the station from which it accepts communications on behalf of the system; or
> (2) Accept accountability for any violation of the rules in this Part contained in messages it retransmits to the system.

This is not an unreasonable restriction. It is straightforward to employ reasonable security (not fancy encryption or much else) in order to comply with the rules.

Look at the wording used for telecommand of an amateur station, Section 97.213:

> (c) The station is protected against making, willfully or negligently, unauthorized transmissions.

It says "willfully and negligently". This means so long as reasonable and flexible precautions are made, the operator is in compliance.

Section 97.205, Repeater Station, states:

> (g) The control operator of a repeater that retransmits inadvertently communications that violate the rules in this Part is not accountable for the violative communications.

Finally, Section 97.109 - Station control.

> (d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.

So it appears that the FCC is trying to be very reasonable and allow us much latitude. They give us plenty of rope, we get to try to hang ourselves.

Again and Again i see messages in the APRS!!! sig that realy do not have
anything to do with aprs as at least i'm using it. All i have seen lately are very
VERY long messages on MIR and who should or shouldn't do this or that. I see
fewer and fewer regular APRS users on here with their questions and answers
to problems. I guess the person that said turn off the switch was right after all.
APRTRACK or whatever it's called is a totally different program and i feel that
this constant MIR thing should be carried on somewhere in a satellite sig. But
again that's just my opinion and i have the freedom to drop out anytime i feel
i need to. With all the unrelated messages here and the HF users abuse of
the Gates i may just give up the whole thing and do like several other local
APRS users have done and just give up and move on to another amateur radio
function. Or maybe better yet i will do what many many older hams are doing
move on to Webphone, Iphone,Cyberphone!. This doesn't require any costly
Antenna's, Digi's,TNC's,Radio's and still be able to communicate with Amateurs
all over the globe. Just hit the DELETE key on this one if you don't like to read
it HI HI.

I'm thinking about it.  Currently the APRS license agreement does not
permit me to use the APRS protocol in this non-ham radio application.
I would have to make a specific agreement with Bob or use a different
protocol.  A different protocol might be better since this application
would not face the same kinds of limitations as those on 1200 baud simplex
digipeating VHF packet.

Chuck

```

```
Gentlemen:

Anyone with a PC can communicate with his tnc without the need for a
special packet program and can set up an AEA PK-232MBX or PK-88 or
whatever.

The elegant way is to use something like Procomm or another general-
purpose comm program. Simply tell the progam the correct comm port. Then
when you turn on your PK-232 simply hit asterisk (*) and it will auto-baud
and come back with the cmd: prompt. You can then kill the comm program and
run the APRS software. (DON'T tell Procomm you want to hang up!)

If you haven't got a comm program (You don't?? You kidding? How do you
read this reflector?) just use the appropriate mode commands to talk to
the comm port. You can easily write a little batch file that automates
```

the whole procedure.

I found years ago when trying to put my PK-232 into KISS mode for 2-meter amateur tcp/ip that trying to use PCPakratt to set up the tnc created more problems than it solved. It seems the same is still the case. AEA puts the tnc into some bizarre host mode from which the only escape is to turn off and pull the battery out of the tnc. Pity they made it so complex.

Rendered body type: text/plain

I have tried without success to download some MacAPRS files from tapr's web site.

The most persistent problem is an inability to decompress the received file. For example, the file "MacAPRS.other.sit.hqx" is on my desktop. When I ask StuffIt Deluxe to "un-hqx" and "unstuff" the file, get the following error dialog:

"Errors occurred while executing the script 'MacAPRS.other.sit.hqx.'   Some commands may not have been executed."

When I ask BinHex 5.0 to just "un-hqx" the file, I get a "No check sum error" reported in a dialog box.

This has happened on other files I've tried to download from taper.

The other problem: when I tried to download the latest version of MacAPRS at around 5 am EST, the first 500K bytes came down just fine, but then the transfer just stopped. I waited for about 10 minutes before stopping the download session, which I was conducting using Netscape on the Mac.

Any ideas on what is happening and how I can fix it?

BTW, I'm using a

- Mac 7200/90 with 24 Mbytes of RAM
- 28k8 SupraFAXmodem
- FreePPP 1.0.4
- Open Transport 1.0.8

Thanks for any help you can give.

... things removed for brevity...

If you want make use of the internet with APRS in an interesting way, let me suggest that you do not impose all the limits of 1200 baud VHF packet radio onto the internet. Relaying VHF packets is useful, but it is about the least useful use of the internet/APRS that I can think of. It would be so much better use of the internet's facilities to do something like send position reports to a central or regional host on the internet. That host keeps a data base of each submitter's last known position. A subscriber can then send a request to the internet host, which returns, via the internet a list of everyone's last known position in one quick message. When a submitter sends in a new position (which indicates an actual change in position), the host could send out updates, via the internet, to interested subscribers. (The host would have some policy about the volume and rate of outgoing messages.)

The whole thing could be done with e-mail, a mailing list package, a few simple programs, and a spare host on the internet.

APRSM@APRS.NET anyone?

Hey, you don't even need a radio or license to join the fun!

Chuck

To borrow a Blues Brothers line...

I didn't do it. It wasn't my fault. It was terrible. A flood. Of locusts. believe me, baby...

:-)

Just recall that most missions, unless they have a mission requirement for a higher inclination, will take the lower energy launch to 28.5 degrees, using the earth's rotation for a few extra KPS. So, I suspect that is what happened here.

In Bob's previous message about using GATEXX instead of XXGATE if that is what he wishes we can do that, it is still early and we are ONLY TESTING right now so changes are easy enough if needed.

Seems that some people thought we were going AGAINST Bob's wishes just for the heck of it but this is not the case. It seems that in the mess of mail, yes, I think some of the messages do become a mess on the sig but I am not a complainer, that I lost the pervious messages that Bob posted about GATEXX.

I try to check the sig 2 times a night but sometimes there is still a lot of mail that I need to sift thru. I often scan the subjects and delete on the fly depending on the # of new messages and the ammount of time that I have that night. It could have possibly been that the message was in a REPLY with a slightly different topic or I was going crazy with the delete ICON and killed a few I did not mean to.

I will get together with KD4UYR and try to sync a change if that makes everyone happy and then one of us will post the change after we have done it. Again Kevin and I were never planing so many people to be so excited and willing to participate. Kevin and I were just going to horse arround for a little before the test started but I guess due to the turnout we now have a "official" pre-test. We are very pleased with the turnout and it is growing every day!

The idea for a store and forward by request internet app is interesting and the mechanism for covering the rules for the control operator is an interesting problem.
I was wondering if the very APRS format could be the controlling security. Only acceptable aprs location packet's would be acceptable, and no btext would be allowed thereby eliminating the chance for offensive btext from unliscenced users. Also one could utilize a look up of callsign using QRZ to verify the location text before accepting it for internet availability

WB4APR REPLY COMMENT:

It has a DCD input for holding off the transmitter if there is a signal
on the receiver. THe DCD is just an input pin. SImplest envelope
detector is a pair of diodes and a transistor...   Yes, ANY noise then
will hold it off. (If you use it).

> Remainder deleted for brevity

While Jon does abstract the rules and examine them with some detail, I'm
afraid he mised a point the FCC *did* make a couple of years ago in citing
several operators for e-mail going through internet gateways from non-amateur
sources. That was what fostered the degree of paranoia concerning this issue.

Chuck, rather than a timed or bin-full derived e-mail list, why not make it a POP-server-like system, where there's no issue of a non-Amateur causing a report to be generated?

If you/we are going to have to recast some of the code anyway, that should be pretty straightforward. I'll try to look at this later next week, after I give the cows another run.

Content-Type: TEXT/PLAIN; charset=US-ASCII

On Tue, 9 Jan 1996, Jess Girard wrote:

> The elegant way is to use something like Procomm or another general-purpose comm program. Simply tell the progam the correct comm port. Then when you turn on your PK-232 simply hit asterisk (*) and it will auto-baud and come back with the cmd: prompt. You can then kill the comm program and run the APRS software. (DON'T tell Procomm you want to hang up!)

[I know what I say below is for the PK-88 in the midst of a PK-232 discussion. I do so because the PK-88 was mentioned in the paragraph before the one quoted above.]

Not completely true. No matter what communication program you use, no matter what you put into INITAEA.TNC, APRS sends a command to the PK-88 which causes it to not work. Bob is aware of this and is looking into a fix for it. I have had much correspondance with him on this regard.

Hi group.
Just getting started on aprs and a few questions if I might ?

1. Have scanned the readme files, using 73e at the moment.
2. Appears we do not want vhf linked to hf ops ?
   Can understand that. But ur comments would be nice.
3. I am working on edge of 30 meters with ts850. scary working
   on edges hi. But see some activity, slows down as night falls.
   I can get *ack* from a few stations, but no short qso as yet.
   Want to see if this works hi. Are some of the signals I am seeing
   for the most part unattended ? thus no contact.
4. Using pk232 with no problem that I know of.
   Any suggestions on what I should set unproto to and beacon ?

thanks again..

great idea!  a pop style server with input via a number of sources like
AX25 tunnels to nos boxes, or update inputs via email, etc...
and then provide a number of predefined reports like:

-list of most current stations by time
-list of known stations by area
-list one station only, with history
etc..
with downloaded output viewable as log type file by programs like APRS

# Fred Kehler      Clearbrook Technical Services Ltd      voice 604 850-3010
# Internet:  cts@clrtech.com.  Amateur Radio TCP/IP:  ve7ipb@ve7ipb.ampr.org.

Date: Wed, 10 Jan 1996 12:41:41 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960110123130.2518A-100000@greatlakes>
Rendered body type: text/plain

```
Being snowed in for 4 days, I cleaned up some of my map structure and
made some new maps:
```

* Added more detail to these maps: USAeast, USAseast, USAwest
* Built a new USAncen
* Made 3 new maps of West Colorado and West Nebraska
* The above additions will allow me to remove 13 other maps from the basic APRS distribution and move them to the regional dsitribution files.

Since I am not sure if I have my latest MAPLIST.USA, the NEWUSA.ZIP does NOT have a MAPLIST in it. Here are the needed entries for the new maps:

USAncen.map,44.5,105,480,
COnwest.map,39.9,107.6,72,
COswest.map,38.1,107.5,72,
NEwest.map,42,102.3,72,

Also, the file NEWUSA.zip will need to be unzipped directly to your MAPS directory since I did not zip it with the directory structure.

You will find NEWUSA.zip on the Annapolis BBS 410-280-2503, since again, it would not upload via kermit to my internet host. Will the first person that gets it, and does not have to use kermit, please move it to tapr? Thanks...

WD9ABE with gate GATEIL saw nothing tuesday night. I heard packets on the hf radio, but all were too weak for the Kam+. Radio is set to 3585.00 LSB, that puts sidebands at 3583.4 and 3583.2, with an average of 3583.3. Perhaps we should start talking the average sideband freq. so that there is no confusion due to different tnc's.

Bob is right, of course. And like Chuck before him, this is a really cool idea, to have a net site that collects the position data. Hey! What about displaying it on a Net version of APRS (a regular version of WInAPRS or MacAPRS that could deal with a virtual net TNC)? Or a Web page that is a map? I think that a mail list that one could subscribe to that would contain all the position reports and would be mailed once every 5 minutes or so.

However, it would be even better if netGATEs, sprinkled around the country, could transmit that data on a regular basis. THis would vastly help out the HF network though nastily circumvent that magic 11% loading number, thus overrunning the VHF networks, irritating Bill KE4EER and destroying Amateur Radio as we know it. Darn. I knew there was something wrong with the idea...

WB4APR REPLY COMMENT:

All this FCC rules business goes away if you let the RADIO data ENTER the internet distribution system, then let everyone get the data on line.

272. APRS registration

From: Mike Tyrrell <100321.1327@compuserve.com>

Bob,

My name is Mike Tyrrell from near Manchester, England and my callsign is G6GAK. I am the local deputy controller for RAYNET (Radio amateurs Emergency Network) and I've been looking at the use of APRS to assist in emergency communication for events in which we are involved. RAYNET is a charity which provides help to local services such as police and Red Cross when they can't cope. (excuse me if you know all this already!).

I'm hoping to use APRS at a large RAYNET event in February, this is our main training event for the year and involves tracking several hundred runners across open terrain over two days. For the past two years we've been increasing our use of mobile packet for results and planning activities. This year we should have a GPS tracking unit on one vehicle and several other outstations either with "dumb" TNCs or APRS.

We've got along fine with the unregistered version so far but I think I really need to register at least the copy which we use in the control station in order to be able to upload more than one object and to have quick start up with saved parameters.

Do you have any discounted rates available for RAYNET registration? I was led to understand that another UK group had been in touch with you but I've been unable to trace them here.

It would also be easier for me to arange payment in $ in the US than in DM in Europe. Is this OK to register directly with you?

Many thanks for your help & the excellent program!

73 & Happy New Year,
Mike G6GAK

P.S. My home page has a picture of the Cheshire APRS map which I've developed. URL is

What.

I thought I knew alot about "things" but this did it.

What would this do for me? I hope not bog down APRS.

I have been running APRS (currently 7.4e registered) with a PK-88 for
quite sometime now without problem.

I don't seem to recall doing anything at all beyond specifying a AEA tnc.

I saw nothing on Tuesday night EXCEPT for Jan in Slidell LA. on the 80M frequency and the local FL APRS stations.

As far as frequency that will vary a little bit right now. On my AEA TNC I show 3.585.32 LSB it is off a little but this is due to the surfing I had to do to get as many stations as possible together. In the meantime after geting everyone in one place I was off myself and decided to stay put. No reason to try to move EVERYONE over a few and create a mess again. We will probably move a little either up or down in a few days but will try to make a announcement prior to this so everyone knows to move a little off. Once we make this move (KD4UYR and myself) that will probably be it. Kevin and I are on 24hrs a day and will make sure we are both zero beat. Everyone else can use either his station or mine as a standard to tune in on since we will not move.

> report to be generated?

I don't understand. How would making it POP-like remove the non-ham report generating issue in a way any different than e-mail? Because you would have to log in over a phone line using your password? That would be pretty restrictive.

The great advantage of sending out e-mail is that you can send out a lot of messages to a lot of different places very quickly, without having to have the receiving hosts connected, on-line, and waiting for the reports. You can also receive reports from lots of places without having to be specificaly connected. There is also an elaborate and somewhat reliable store-and-forward system in place for e-mail. And e-mail is supported on just about any platform. Only a limited number of connections are possible in a POP server system and access is economically restricted to local geographic regions. E-mail is also completely free in most places.

If I implement something, it will be an internet e-mail thing between internet hosts. Hams and non-hams could use it. I would not be able to tell the difference. It would be for position reporting and would not support text messages between users. There would probably be a UNIX/X11 map display program similar to APRS that could run on UNIX hosts (on the internet) or a JAVA display system or something or several things... Perhaps a WWW page where the general public could look at the current map(s). But you would not need that to participate. E-mail would be sufficient as a bare minimum. I would hope that things could be structured compatibly so that you could display this information (and send out e-mail position reports) with the APRS program while it was also running your TNC and radio. I would not expect APRS to gateway the e-mail info onto radio (at least not by default!).

Various policies could be used to determine when and what is sent out on the internet to interested internet receivers, different policies could be used for different receivers, but verifying that a sender (or receiver) is a licenced ham would not be one of the policies, since this can not be done reliably.

If someone wants to take information that they received via e-mail, possibly reformat it, and transmit it on VHF as APRS position/object reports, then that would be their responsibility. I beleive this can be done as long as it is done manually, or at least not too automatically, similar to the weather alert reporting discussed on this list recently.

It would probably be ok for an APRS station with e-mail to transmit the e-mail position reports (assuming that it verifies that the content is indeed position reports intended for public distribution) to another APRS station IF THE OTHER STATION REQUESTED IT and that the original e-mail senders gave their permission. This would be similar to repeaters and digipeaters. The control operator of the repeater doesn't really know that the users are licenced, but they access the facility via ham radio so it is a somewhat safe assumption. Someone else has to act illegally (by unlicenced transmission in the ham band) to make the repeater operate illegally.

Of course there would be no guarantee that any of the information would be correct, timely, or useful.

Chuck

> From: lmkeeran@ilstu.edu (Larry Keeran)
>
> What would this do for me?

Depends on your situation.

If you have an internet connection:
 You could watch things in other parts of the world.
 You could fill up your local APRS map with all the fixed local stations and last reported positions of local mobiles (or histories) much faster after staring to run APRS.
 You could probably find out about things that happened in the receint past instead of just while you were listening.
If you do not have an internet connection:
 You might be able to request another station with a connection to get the above information for you and transmit it over VHF (probably bogging down APRS)

> I hope not bog down APRS.

I would not want to see e-mail derived information regularly retransmitted on 1200 baud VHF (or even worse HF). This would really bog things down. Especially when you can get tons of e-mail position info from all over the world. The way I see it, VHF is best suited for mobiles sending their position reports to local APRS systems, to local WIDEs, to local internet e-mail (one-way) gateways, or rarely to local hf gates and VHF is good for fixed stations sending info needed by local mobiles. It would seem to me that fixed stations with internet connections would perform much better getting all of their non-local and most of their local information from the internet.

Maybe it would get people to slow down their beacons which currently bog down APRS.

Chuck

Yep, contact Kantronics and ask if you can get a Version 8.0 chip.
It will do the same as the KPC-3 chip and HF also...only problem is the bug that happens at 00:00 Zulu. Slightly bothersome but you can live with it.

The PK-88 will work with APRS. It depends on the date of the EPROM on
whether or not it will require manual intervention.

I have one with a date of 16 May 89 that the VHF command will cause
TONE to be set to 2. It needs to be 3 to work right.

I know of another PK-88 with a date of 23 Aug 91 that does not reset
TONE to 2 when the VHF command is issued by APRS.

The idea for a store and forward by request internet app is interesting and
the mechanism for covering the rules for the control operator is an
interesting problem.
I was wondering if the very APRS format could be the controlling security.
Only acceptable aprs location packet's would be acceptable, and no btext
would be allowed thereby eliminating the chance for offensive btext from
unliscenced users. Also one could utilize a look up of callsign using QRZ to
verify the location text before accepting it for internet availability

283. New WIDE-RELAY in southeast PA

From: mark@y100.com
Date: Wed, 10 Jan 1996 16:42:46 -0800
To: aprssig@tapr.org
Message-ID: <199601110042.AA18809@relay.interserv.com>
Rendered body type: text/plain

```
I finally had a chance on Saturday (1/6/96) to install a new 145.79 MHz
"WIDE-RELAY" digipeater at Eagle's Peak, near Newmanstown, PA (Lebanon County),
about 12 miles west of Reading, PA.  This site is approximately 1380' AMSL and
840' AAT, and should provide good coverage to Lancaster, Reading, Lebanon, the
eastern side of Harrisburg, and the western side of Allentown.  This is also the
site of the N3KZ (University of PA) 442.4 MHz repeater.

Couldn't climb the tower due to ice, so the antenna is temporarily mounted on a
fencepost until weather conditions improve.  The callsign is N2CHV-3, and
UNPROTO path has been initially set to WIDE,WIDE.  WB4APR reports no problem
copying it at his home QTH south of Baltimore.  Expect a noticable improvement
in coverage after I mount the antenna up on the tower above the trees.  With the
weather we've been having around here, this may take a while!

73, Mark N2CHV

I recognize that the FCC in the past has dinged some scofflaws %^) for
doing nasty things. But these were probably not isolated events.
Almost certainly there had to be fairly egregious violations of the
rules, which would tend to bring the ire of some within the Amateur
community and certainly the FCC. Paranoia is rarely a reasonable
emotion by which to be guided (except of course when you really know
that they're all out to get you and that they're reading your e-mail
and %&#(%&#()&%)@#%)@)*)*%*)#*)#))))**...

However, it seems that as David Barrett said,

"I was wondering if the very APRS format could be the controlling
security. Only acceptable aprs location packet's would be
acceptable, and no btext would be allowed thereby eliminating the
chance for offensive btext from unliscenced users...."

This may very well be a simple way to attain salvation for the APRS
format. The first part is an especially valuable observation.

73 - Jon NW6H

> Remainder deleted for brevity

While Jon does abstract the rules and examine them with some detail, I'm
afraid he mised a point the FCC *did* make a couple of years ago in citing
several operators for e-mail going through internet gateways from non-amateur
sources. That was what fostered the degree of paranoia concerning this issue.

Please elaborate what you mean. WX beacon reporting rate? Over VHF, HF?

Position reports from fixed stations (rate controlled by APRS program)

or Mobile GPS reports?

We have (I'll bet) the busiest APRS net I know of here and it is not bogged down. Well... unless someone has set a wrong UNproto WIDE,WIDE,WIDE or WIDE,RELAY   or like the Florida station:
GATE,WIDE,RELAY

Yep, contact Kantronics and ask if you can get a Version 8.0 chip.
It will do the same as the KPC-3 chip and HF also...only problem is the bug that happens at 00:00 Zulu. Slightly bothersome but you can live with it.

> restrictive.

I suspect you are missing a couple of of points. POP does *not* assume a dialup line. It does require an action by the AMATEUR to initiate the data transfer. That meets the letter of the Rule, and made the FCC happy in the past.

Lessons learned from a long time in packet...

> The great advantage of sending out e-mail is that you can send out a lot of
> messages to a lot of different places very quickly, without having to have the

> place for e-mail. And e-mail is supported on just about any platform. Only a
> limited number of connections are possible in a POP server system and access is
> economically restricted to local geographic regions. E-mail is also completely
> free in most places.

It's still E-mail. It merely resides on an APRS POP-server. For what it's worth, there are several low-cost to shareware/free Visual Basic shims to add TCP/IP utility to VB. And if we end up recasting the package into a *nix version, IP is pretty straightforward hack from there.

> If I implement something, it will be an internet e-mail thing between internet

I *really* like the JAVA applette idea. Sure wish I'd thought of that!

I suspect X11 will be a bit of a job. My priority list just got juggled, so I doubt I'll get to try that anytime soon.

> Various policies could be used to determine when and what is sent out on the
> internet to interested internet receivers, different policies could be used for
> different receivers, but verifying that a sender (or receiver) is a licenced
> ham would not be one of the policies, since this can not be done reliably.

Using POP, or something like it, accomplishes this. If the POP request is embedded inside the user program, and is transparent (no more than telling the program which APRSPOP to use, maybe with a default already coded in that'd work?) then it should not be an issue.

> If someone wants to take information that they received via e-mail, possibly
> reformat it, and transmit it on VHF as APRS position/object reports, then that
> would be their responsibility. I beleive this can be done as long as it is
> done manually, or at least not too automatically, similar to the weather alert
> reporting discussed on this list recently.

There are a number of hosts already connected that are connected via RF. Therein lies the issue. And, it's a nit, but a nit that has bitten a number of folks.

> It would probably be ok for an APRS station with e-mail to transmit the e-mail
> position reports (assuming that it verifies that the content is indeed position
> reports intended for public distribution) to another APRS station IF THE OTHER
> STATION REQUESTED IT and that the original e-mail senders gave their
> permission. This would be similar to repeaters and digipeaters. The control
> operator of the repeater doesn't really know that the users are licenced, but
> they access the facility via ham radio so it is a somewhat safe
> assumption. Someone else has to act illegally (by unlicenced transmission in
> the ham band) to make the repeater operate illegally.

Unfortunately, the current rules make it the responsibility of the sysop of the FIRST station that brings data into the packet system to make sure it's OK. It's *NOT* simply a case (as we'd much prefer to see) that the originator of the offending material be held culpable. And, if a non-ham initiates something that "erroneously" gets out to packet and wreaks havoc, he can claim ignorance.

> Of course there would be no guarantee that any of the information would be
> correct, timely, or useful.

Of course! It's a hobby! :-)

Cheers, Gerry

Thanx Mark,

You're right. I got a lot of mail from "know-it-alls" and the "holier-than-thou" types telling me to read my back issues of QST and "where have you been for the past year."

Thanx.

Out of the dozen replies I received only two, including yours, were helpful. The rest were judgmental and accusatory.   I really appreciate your reply. It's nice to know there are some people out there who are willing to help someone who just subscribed to a SIG.

Thanx again,
hooloovoo1@aol.com
N3NGB@WB3FFV.MD.USA.NOAM

p.s. I really liked being told to read my QST's, especially since the only place I can get one without a subscription is 1 1/2 hours away.

291. APRtrak - SPRE part-II

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 11 Jan 1996 13:40:43 -0500 (EST)
To: amsat-bb@amsat.org
Cc: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960111130231.14657A-100000@greatlakes>
Rendered body type: text/plain

Once you have APRtrak unzipped, loaded, and working with your TNC, and have READ all the files in the README directory, you will be able to rapidly move between the APRtrak screens to see the packets being parsed using several single Key commands:

SPACE BAR displays the map. Use PgUP/DN, HOME and arrows to ZOOM

L - LATEST. Will only display the LAST packet seen per station.

P - POSITS. Holds the posits of any stations reporting same.

A - ALL BEACONS. This is the chronological page of all NEW packets.
    It does NOT update in real time, so you have to keep pressing
    "A" each time you want to see the latest.

V - This is a conventional scrolling text display of raw packets

D - DIGIPEATERs. This display shows the packet headers being used.

alt-T - This page displays the telemetry.

Z - HORIZON. This is an interesting display showing what the SKY
    looks like from your backyard or wherever the MAP cursor is.
    To see the default horizon (Annapolis), center the map on your
    station and press Z. You can customize this HORIZON following
    the steps in SYSTEM\HORIZON.DAT.

alt-F FAST. This will make the satellites move FAST. It is
    interesting to watch on the HORIZON display.

NOTE!!!! I just discovered that APRtrak defaults to Mcom OFF. This will prevent you from capturing the REFLEX and other non APRS packets! Without Mcom ON, you also will not see the full packets on the ALL PAGE. To toggle MCOM ON, use the APRtrak CONTROLS-MCOM command.

APRtrak will then try to set MCOM on in your TNC. AEA TNC's use a different command which you will have to set yourself using the OPS-COMM mode to talk to your TNC directly.

```
Not only does MCOM in APRtrak turn on MCOM in your TNC, but within APRtrak
it also ENABLES the saving of ALL packets including the HEADERS on the ALL
page and subsequently that is what is saved in the LOG files.  So even if
you can't get MCOM ON in your TNC, be sure it is ON in APRtrak.  When it
is ON you will see it in the CONTROLS display (Hit the TAB key to show it).

Hope to see you on the map!
```

Many of the latest Yaesu's also have this feature (audio in mic connector
if wired).  The software carrier detect is much more sensitive and will be
more likely to get weak signals ... this is very nice if you have the
ability ... The only bad time is if you are using an HT in which case you
have a bigger drain my having the squelch always open ...

You guys should be using Pactor, not packet. The multipath is killing you.

Most APRS is done in the daytime on frequencies (10 MHz) which are open
then. Nighttime is multipath time.
```

When the German developers of Pactor were looking for the toughest situation to overcome, they chose 80 meters in winter....

295. APRtrak and SPRE part III

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 11 Jan 1996 19:08:37 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960111185106.21729A-100000@greatlakes>
Rendered body type: text/plain

At the bottom of this file are the latest KEPS for STS-72 and MIR. In APRtrak, use the FILES-KEPS command to update your KEPS from this file.

NOTES:
1) Use a DOS editor to change one of the existing satellite object numbers in APR.ORB to the object number for STS-72. That is 23762
2) Now use the FILES-KEPS (NASA format) to update from this file.
3) Do NOT use the AMSAT format for updating, because it appears to wipe out all the satellites and only bring in the new one...
4) If you accidentally wipe out all your satellites, you can copy the APR.BAK file to APR.ORB and you will be back in business...

Be sure your DATE, TIME and TIME ZONE are correct.

Once SPRE is deployed, do NOT update your KEPS if you want to keep tracking SPRE. If you want to update the shuttle KEPS, then use an editor to change the name from STS-72 to SPRE and give it a fake OBJ number. Then change another satellite to 23762 and do an update. But remember that the shuttle does have to come back to the SPRE position to pick it up.

Ralph:

As you know I'm relatively new to this, so I asked around before I answered you. There is a lot of activity on 2 mtrs. (145.79) There are many stations in Lexington, Cincinnati, and farther north of Cincinnati. There are a few in Dayton as well. My station is on 24 hours a day (attached to Ultimeter 2000). Another good contact in Cincinnati would be KB8IFX. He's very knowledgeable and has helped me a great deal. He also runs a portable or mobile occasionally.

As to HF, there is little or no activity around here. I am a Tech+ interested in DX so I want to use the software on the DX Cluster (as well as for weather) when 10 meters opens up again.......I've got 180 countries now and need all the help I can get!

Hope that helps.....let me know if you need additional info.

Regards,

Bob   N8NGA

Subject: [APRSSIG:5903] Cinci. OH APRS

What kind of activity is going on in Cinci Ohio?
We have a fellow here in Atlanta who is here on assignment. He's an HFer and
also does a little packet. He's from Cinci and goes home every other weekend.

What can I tell him is active there and on the way up (North of TN)?

Trying to get him interested in APRS.

Ralph

Strange,

I have used the PK-88 over the summer on both VHF and HF as I travelled all
over the country using HSP mode and hadn't noticed a problem, other than making
sure the TNC was in the correct tone setting (1 if I remember correctly), and
the right baud rate.  I only had to set the above if had reset the unit.

If there is still a problem, I can test it here under os/2 and trap the com
port communications that are going on.  It will tell me exactly what commands
are being sent.  Which tnc are you describing when you first start APRS??

cheers...mike

Our last opportunity to digipeat APRS via the Shuttle was a disaster.
Only about a dozen stations even tried, I guess assuming that everyone
else would.  Only ONE posit got through.  THIS SPRE experiment is APRS
from the ground up.  We better make it work this time, hi hi
```

Please be sure that SOMEONE in your area is sending out a BULLETIN on
your LOCAL APRS frequency alerting all operators of the SPRE APRS
experiment which begins at 0-dark-30 SUNDAY morning. It will be on for
46 hours, BUT EACH ONE OF US WILL ONLY GET FROM 2 to 6 passes TOTAL.
depending on your latitude. For the US, most of these passes will be
during the dark morning hours of SUNDAY and MONDAY. I will post
some better figures when I run the KEPS through my InstanTrack.

Remember, someone please put out LOCAL beacons on your APRS net alerting
everyone to this BRIEF golden opportunity. And dont forget to switch to
145.55 SATURDAY night before you go to bed. SET UNPROTO to W3EAX and set
SPACE mode ON..

Pactor would be interesting but in a APRS situation I do not know how that could
be incorporated. I do know that Bob started to write a AMTOR mode a long time
back but I do not think that ever took off, don't think PACTOR was ever even
started.

Just a request to those of you attempting to use Windows95 and the mail
program associated with it... Please, please, PLEASE use another mailer,
or figure out how to configure it to send standard documents (what you
type to us) in ASCII format.

I do *not* routinely use a metamail-aware mailer, becuase most of what I
receive can be dealt with faster and more efficiently with Elm.

Micro$oft has decided that everyone on the internet is, or should be, using Windoze95 and their MSMail program. As there are a bunch of us using other operating systems, and better mail systems, they are kidding themselves.

Thanks for the bandwidth,
Gerry

305. oops SPRE SUNDAY NIGHT!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 11 Jan 1996 23:59:37 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960111234632.22242A-100000@greatlakes>
Rendered body type: text/plain

I lead you slightly astray. Yes the SPRE will be deployed about 0650 EST Sunday morning, but this will be AFTER the morning passes over the US. We won't get our first pass here in Maryland until 0102 Monday morning the 15th. So here is the present outlook for Maryland

```
MONDAY  15th 0102 Eastern Standard TIme.
             0236
             0413
             2341
Tuesday 16th 0116
             0252
```

The further south you live will add additional passes about 90 minutes before and after the ones posted above... So SUNDAY night, everyone set to 145.55 with the UNPROTO path of W3EAX before going to bed, and set SPACE MODE. APRS will work un-attended to make your contacts.... we hope..

You are right as a practical matter. I was just commenting on the
probable futility of successful 300 baud packet on 80 meters on a winter
evening. I never recommend HF packet to anyone.

APRS is probably the best application that exists for HF packet - UI frames
instead of connections, and an application which degrades gracefully if
data input is intermittent.

We are working on a pactor 'tracker' for fishing boats - your GPS
receiver with periodic lat/long strings sent out via pactor FEC. Not
applicable to what you are doing, of course.

WB4APR REPLY COMMENT:

Yes, you must load SPRE.BK if you want to see the telemetry in true
engineering units.  Notice the difference between the alt-TELEMETRY page
when the file is loaded and not.  Actually the special TELEMETRY
equations are activated as long as W3EAX is the FIRST station on the
LATEST list.  That is all the SPRE.BK file does (I think) is to be sure
that W3EAX is the FIRST station heard.

Oh, that file may also contain the location of the SPRE on the day we
tested it in the clean room at Goddard.

WB4APR REPLY COMMENT:

See README\SPACE.txt and activate it under alt-SETUP-MODES-SPACE.
It will assure you use the shortest packets and will schedule your
station for automatic operation with the SPRE while you sleep.

WB4APR REPLY COMMENT:

APRtrak will do everything unregistered, but will be limited to one page
of calls and posits.  APRtrak tho WILL decode the telemtry and SPRE posit
APRS will not.

APRS SPACE mode will work just fine for the plotting of digipeated POSITS.
```

316. APRtrak ARMED mode

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 12 Jan 1996 11:19:30 -0500 (EST)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960112105843.25212G-100000@greatlakes>
Rendered body type: text/plain

```
SPACE mode in either APRtrak or APRS "ARMS" your station to listen
for packets from the SPACE DIGIpeater.  Once it hears a packet from the
space digipeater callsign, THEN APRS will reset its POS/BCN timers back
as if you had just entered a new posit.  Your BCN/POS periods then decay
again as usual.  (Unitl the next such packet heard...)  In SPACE mode
your BCN and POS are the *same*.  They are simply your *brief* BCN with
the grid square in the TO address.

REPEAT:  THe triggering packet *must* come *from* the DIGIPEATER CALLSIGN,
not just be digipeated *via* that callsign in order to wake up your POSIT.

Since SPRE transmits its own telemetry once every 30 Secs, this should
easily trigger your station.  Again, a good way to test it is to set up
APRtrak/APRS with a local station, let your beacons decay out, then have
the other station transmit a packet.  For APRtrak/APRS to recognize this
packet, of course, the packet can have NO MORE THAN ONE digipeater in its
path.  Else the whole packet is ignored as a NON space packet.

If for some reason this is not working, then you can reset your BCN/POS
periods by simply updating your BEACON or your POSIT.  Using the alt-B
command and re-typing your *brief* BCN should do it...

On Fri, 12 Jan 1996,
someone wrote:

> ....  I tested APRtrak......  Everything seems fine
> except that APRtrak isn't *automatically* starting to transmit when the

317. SPRE Mobiles!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 12 Jan 1996 12:14:01 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960112112206.25212H@greatlakes>
Rendered body type: text/plain

```
Well, what the heck, we only get 5 passes, so lets show-off!

HIGH POWER MOBILES in the SOUTHERN states might consider going mobile
during a pass.  Do NOT set SPACE mode in the  mobile station,  just set
UNPROTO to W3EAX and pos rate between 35 top 10 secs.

0)  This is only worth doing if your VEHICLE symbol appears
1)  Vehicles in motion will show the CSE/SPEED leader line
2)  If you are stopped, then APRS may decay your POS rate
3)  Being in motion will be dangerous
4)  A Mobile posit is a LONG packet.
5)  Your driveway is ontop of your house at the 512 mile scale

CONCLUSION:  Seeing MOBILES on the map could be neat, but the drawbacks
are the LONG POSIT packets required and the lack of the automatic
SHUT-OFF on success built into the APRS SPACE mode.  The most effeceint
way to get the MOBILE posit transmitted is a MANUAL posit entry in your
MOBILE TNC BText.  As follows:
    WB4APR>APRS,W3EAX:/150602z3859.11N/07629.11W>340/030

The course and speed on the end are optional, but DO put in one of the
mobile symbol characters.  Set to once every 35 secs if unattended
and 10 secs if you have a means for stopping it once you are digipeated.
(Avoid 30 secs since that is the rate of SPRE itself)

You might consider offsetting the posit slightly from your HOME QTH so
they dont appear on top of each other.  But test the location of your
GIRD SQUARE report first.  Your Home QTH will NOT appear to everyone else
where it is on YOUR map.  To see where it is, have someone force your GRID
SQAURE packet on the air, and see where it falls.  Then force your mobile
to be a pleasant distance away...
```

Didn't get a precise hack.  I do know, however, that it was 23 minutes late
after a commo delay.  I suspect it was precisely 23 minutes late, placing the
launch at 10:41:00.00001 UTC.  Usually, when they pick up the count, the
Launch Director tries to make it go *ON* the second.

Today during a visit of a NASA VIP, I was not only offered but almost
commanded to put together a Payload for an upcomming March 96 launch.
The size can be as small as one of my PicoSATS or larger. It can be
a stick-on payload onto an existing package, or maybe a free-flyer...
No details at this point.

Alll I want to do is put up a 1 watt Picosat AX.25 FM 2 meter 1200
baud packet transponder for digipeating SHORT UI frames only.
(Position reports) The conventional FM is for maximum participation by
low budget schools and students... etc...

5 watts if it is a piggyback payload...

If I am going to do this in 6 months, I will need SERIOUS help. Does anyone have any closet space parts that they can spare? I am thinnking of a TNC, radio, and power supply only. Using a PacComm TNC, that gives me two on/off functions and 4 channels of analog telemetry, plus the digipeater, or course,. I want it simple.

I shure would like to have the new USA maps Bob made while snowed in. If someone has access to the BBS where they are would you please upload them to TAPR!! Or Bob if you would email them to me I will upload them to ftp.tapr.org . If you choose to email I find it is better to paste each individual map into an email message and send it rather than sending an attachment. Since the maps are already text, uuencoding is a waste for a couple of maps.

I load Iphone most everytime I get on the internet. I stay joined to amateur radio only (APRS) and APRS ham radio only. I shure wish someone else would drop in for a QSO !! Also I join   aprs
this is a private channel it will not show up when you list topics. You must hit topics then type in   aprs   then hit the"join private" button.   Only people who know the topic is there can join. This helps keep down unwanted "nuts" only us sig nuts know abt it he he.

Hi and thanks for reading...

Al, N3KAE here in Northeastern PA. I'd like to take a stab at 80 Meter APRS tonight and maybe over the course of this weekend.

Please give me the "proper" settings for ALIAS and UNPROTO.

I will be using my TS440S and a dipole;; running somewhere between 30 and 80 watts.

Any help will be greatly appreciated since the rig is already warming up!

TNX ES CU ON HF APRS... 73 DE AL, N3KAE ldajz@epix.net or via this

WB4APR REPLY COMMENT:

No, we have the data radios, but the launch opportunity vaporized. We
are now concentrating on the original BASEBALL size Picosat using the
very low power MIM module to transmit its telemetry once every 30 secs
for a year using a few Lithium batteries. No solar panels, since it wont
stay in orbit for a full year anyway if "tossed" from the shuttle.

Rendered body type: text/plain

Erratta:

1) I just noticed a problem with the SPACE/ARMED mode in both APRS and
APRtrak when used with a dual port TNC. APRS is looking for a
match between the callsign of the Space digipeater and what you have in
your APRS unproto string in order to reset your POSIT/BCN timers from
the default 9 minute period. Since the dual port TNC's display a dual
UNPROTO string (ie: APRS via W3EAX/APRS via W3EAX) the comparison
always fails due to the concatenated "/APRS". This will prevent you from
being successful in unattended mode. When you see the shuttle/SPRE, you
may re-set your BCN/POS timers by re-entering your BCN and POSIT.

2) Since the AMSAT-NA office is closed there will be no further
registrations of APRtrak. You may use APRtrak unregistered for the
upcoming SPRE with the following considerations:

    Since only one page of contacts will be displayed, do a manual

FILE-SAVE when the Posits page fills up, then note the last call
and do an additional FILES-SAVE when that call gets bumped to the
top of the list. Repeat this process throughout the pass.

You can use a DOS editor after it is all over to merge your various

backup files and track history files together.

3) If you have two packet stations and two TNC's please use one as a
dumb station and capture EVERYTHING to disk. We have never seen SPRE
move (while it was in the clean room) so who knows what will happen
during these 5 brief passes when it is moving at 17,500 MPH...

So far 80M has proved to be much more successful than we had thought before we
had started. Right now myself and KD4UYR are the only stations on 24hrs so I am
only becoming familiar with the West Palm Tampa path. Once others are on a
little more we can then assess the paths to other areas of the state.

Given that 40M is worthless during the night and 30M is out of FL Skip range and
the other bands when open would only be successful for DX ranges 80 seems like
our only hope.

Some well placed HIGH POWER 6M digi's may also help a LITTLE but unless we do it
on 80M I think that the statewide net will be difficult. I have some equipment
and am gathering more for 6M digi's but I am far far from anything formal for
that. If others can start THINKING about 6M with a minimum of 100W and a high
location (more than 100 or so feet) some good chunks of the state can be
covered. For now 80M will be the primary test bed and I will play on 6M with
some friends while I learn more about it. The ticket on 80M I think will be the
low height antennas (NVIS Techniques) and some research. 80M will not be easy
and will probably not be 100% but I think we can see a great improvement after
some tests and changes are made with antennas, this will not be a "plug and
play" scenario.

Hey Gywn:

Pardon my ignorance but is PACTOR FEC like NAVTEX? Are they the same
thing? Seems like what you're doing for commercial fishing boats is
the same way things should be done on 80m APRS.

And while I'm on it, HF packet would work a lot better if everyone
shortened their packet lengths down to 40 char or less. Yeah, there's
a significant increase in overhead per bit of data, but the HF fade

won't bite so badly and more packets will get through and hence fewer
retries! I'll bet overall throughput will increase.

73 - Jon NW6H

You are right as a practical matter. I was just commenting on the
probable futility of successful 300 baud packet on 80 meters on a winter
evening. I never recommend HF packet to anyone.

APRS is probably the best application that exists for HF packet - UI frames
instead of connections, and an application which degrades gracefully if
data input is intermittent.

We are working on a pactor 'tracker' for fishing boats - your GPS
receiver with periodic lat/long strings sent out via pactor FEC. Not
applicable to what you are doing, of course.

Gwyn

That could certainly explain why I could'nt get it to work... I'm using a KAM.
I guess I'll hook up a KPC-3 for the passes.

Thanks for the feedback, Bob! Hope to see ya on the bird!

Thus spake Guru Bob:

Using the latest SPAR deploy data here is a Sat track for Dallas Texas.
This will show an example of what information is in a a sat track list.

Note that even the best passes are only 8 Mins. and all are in the morning
unless it keeps going more than 48 Hrs.

The units are km for range and height and note the doppler shift as it is
going 7.7 km/s

All this can change so please just take this as an example and use your own
tracking program and latest data.

```

336. 80m traffic

From: "Jon T Adams" <Jon.T.Adams@jpl.nasa.gov>
Date: 12 Jan 1996 23:40:26 -0800
To: "aprssig@tapr.org" <aprssig@tapr.org> (Return requested)
Message-ID: <0611130F761EA001*/c=us/admd=telemail/prmd=nasa/o=jpl/ou=ccmail/s=Adams/g=Jon/i=T/@MHS>
Rendered body type: text/plain

This evening at 0328z I received a position packet from KJ7HZ-1 somewhere around SLC (4031.48N,11150.55W). Freq was 3584.8kHz. Also got position packet from WB6NGC but he's only 6 miles away.

Can anyone tell me what the command to stop displaying my own packets is
for a KPC-3 tnc?  I'd like to be able to use the SPACE mode, but can't
determine which command I need to change.  Thanks in advance! 73. Cap

Where are you located Doug ??
I THINK I have seen a BEACON from you in the past week but never a POSIT report.

If you need to confirm your tracking software is properly showing the
shuttle postition and you have netscape; here's a nifty URL for you.

http://shuttle.nasa.gov/sts-72/demos/

This will automatically update the shuttle track and attitude if you set
your web browser to 0K of memory and 0K disk cache.

MXmit Off   is the command.

That's assuming your KPC-3 has version 6.0 or later firmware. If its older than
that you don't need to worry about it because the older ones don't display their
own packets anyway.

Check that the UTC or GMT time is correct in the Frame.
Last night is was over 1 HR old and showed the same position.
(Stuck in Space)

I use the Cable TV's Nasa select .

344. SPRE Sunday Morning!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 13 Jan 1996 12:35:32 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960113115913.28093B-100000@greatlakes>
Rendered body type: text/plain

Ignore my previous predictions since the Shuttle is manuvering a lot.
Although in Wash DC, we will not see SPRE until SUN night because it is
deployed just after our last Morning pass, everyone in the south and west
may have from 1 to 3 passes SUNDAY MORNING after 0630 CST. So set up
SAT NIGHT on 145.55 if you are going to sleep in... See below from KC5EJK
for Dallas TX. IN CENTRAL STANDARD TIME.

```
           Time CST            Az    El (highest per pass)
 DAY   MM/DD/YY HH:MM:SS      Deg   Deg

345. APRtrak false alarm

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 13 Jan 1996 12:40:55 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@tapr.org
Message-ID: <Pine.SUN.3.91.960113123712.28093C-100000@greatlakes>
Rendered body type: text/plain

When you load the SPRE.BK file to show APRtrak that it is working the
W3EAX SPRE, you will also be loading historical data in your TELEMETRY

```
page and in your HEARD log.  Ignore this old data and carefully look at
the TIMES for any new data...

---------- Forwarded message ----------
Bob. APRTRAK snookered me.... ..  I had it on last night armed for the early
Shuttle passes knowing that SPRE wasn't scheduled yet.  I checked my
heard log and saw that I had 17 entries of w3eax.  I then checked the
logs and saw the telemetry.  I was about to save off the files when I
realized that the times didn't check out.  It was then I realized that
when I loaded that spre.bk file, it put w3eax in my log. hi  Good thing I
didn't go running out and tell everyone I worked the shuttle....
```

Bob this is the problem I reported with the KPC-4 a couple of weeks
ago. I published the circumvention, but you may have missed it.

Use the "O" "D" to store the digipeater path that you want to use for
space mode. Store it without any slashes (just like it would look for a
single port model.

Then load that path and go into space mode and it should work properly,
it does for me.

I have never been very much into the Sats but I have decided to try SPRE this
time at the last moment.

Where is the best place to get updated KEPS, I know that they change often so
I will like to stay as close as possible.

Also is there a location on Internet to lock on a standard time with your PC. At
one time I had a program that did this via modem but I have since lost the
software.

Just a quick note:

For a GREAT satellite tracking program checkout ==> STSPLUS !!!
Can be found on Celestial BBS ==> 513-427-0674. I'm pretty
sure this number is correct... I will repost later if not
(I'm at work)..... That may be an old number.....

The files are labeled SOP95XX.ZIP; there should be two of them.

IT HAS THE BEST GRAPHICS OF ANY SATELLITE TRACKING PROGRAM I'VE SEEN !!!!!

Check it out and let me know what you think!!!
```

```
ENJOY !!!!

Message-ID: <199601132027.NAA25034@usr5.primenet.com>
Rendered body type: text/plain

```
For the latest, almost minute by minute Keps updates for STS-72 on the net
go to:

ftp:\\amsat.org/amsat/keps/sarex/sts-tle.txt

I have found that you need to edit them by removing the extra spaces between
the header (STS-72) and the TLEs, also, between line 1 and lone 2. When
edited in this way you can update the keps into the APRtrak APR.orb file
automatically using the F   K    2 commands in the program.

Hope that tis information helps. I found out from an active AMSATer here in
Prescott, and have been updating my Keps that way for the last two (2) days.

73, and hope to see everyone on SPRE.

WB4APR REPLY COMMENT:

DEVICE NOT AVAILABLE. Usually the COM port. My 486 laptop will ALWAYS error that way if I let it BOOT WINDOWS first. Windows does something to the COM ports. Boot straight to DOS and it should work. ALso be sure you are using the right COM port or at least one that exists.

WB4APR REPLY COMMENT:

Although we are all excited and awaiting the latest news (I still dont have a beta test copy) it would be premature to start talking about it here, since that would generate lots of messages that Sproul Bros would feel compelled to answer, and they are VERY busy, hi hi...
So, lets all wait for the official BETA comming out in a few weeks...

That is what the KPC-4 does IF you issue the UNPROTO command.

Did you try it?

It appears to me that APRS handles if differently when it comes from the saved list. As if it puts that path in the APRS save area for the path and does not issue the UNPROTO to see the path.

I am not sure why it works, but it does. Don't issue the UNPROTO or it will mess it up. Test it with a local station and I think you will see that it works. At least it does here and the KAM and KPC-4 are logically the same.

363. need help

From: KD4EMI@aol.com
Date: Sat, 13 Jan 1996 21:38:40 -0500
To: aprssig@tapr.org
Message-ID: <960113213840_40991756@mail04.mail.aol.com>
Rendered body type: text/plain

```
Hey folks...just found a kam version 2 (1987)

Picked it up for cheap...

Anyhow..no books though and I need some help.

(waiting on info about upgrading it to version 5 which a friend has
```

and doesnt need)

Anyhow here is the problem.
I can talk to the tnc no problem, except when I first start aprs.
Seems as though I get gibberish until I turn on-off the tnc.
Then everything seems to work ok, (except none of the initializing data
went to the tnc)
If I do it in the oct mode then it works fine, and generally aprs seems
to be working on it ok, just this start up bug..
Any suggestions...AND, anyone know abt these old versions of the KAM..?
Thanks in advance...MIke KD4EMI@AOl.COM

364. SPRE-APRS & Dual Ports

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 13 Jan 1996 21:40:07 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960113213255.29381A-100000@greatlakes>
Rendered body type: text/plain

MR MICHAEL R HESKETT <MBTD87A@prodigy.com> Mike - WB5QLD figured out a
work around for the problem of APRS not properly waking up in unattended
mode when using a dual port TNC because of the dual/port UNPROTO command
format which confuses APRS as to what SPACE-DIGI it is listening for...

His solution is to put W3EAX in the OPS-DIGI list and load it from
there. Apparently APRS then takes just the W3EAX without taking the
actual dual/port string echoed from the TNC. THis does NOT help APRtrak,
since it does not have the OPS-DIGI commands, but it will allow your
station (if placed in the alt-S-MODES-SPACE) to reset its BCN/POSIT
periods to minimum as soon as it hears W3EAX.

Rendered body type: text/plain

Reference the earlier note as to where to find the 'best tracking
program', there are several dozen good programs available.

The Shuttle Orbiter Program (SOP95XX.ZIP) in its latest release
may be found in File Area 28 on the Dallas Remote Imaging Group
BBS at 214-492-7057 (telnet bbs.drig.com)

See the listing in the Files section (area 28).

How do i get APRS out of the ARMED! mode. Attempted to beacon SPRE but
didn't even hear it after deployment and making it's first pass. Did pick up
half a dozen Mir beacons including my own while APRS was running Hi.

Rendered body type: text/plain

>From Nasa Select TV
SPAR Deploy at 5:32 CST

Nothing on the pass.

I have been tracking using ALL the given Shuttle and SPAR keps
and it looked like the SPAR was between the SPAR-00 and SPARTAN keps
posted on the SIG for the 7:00 AM CST Sunday morning Dallas pass.

I guess it was not turned on for the First USA pass. Next pass for us
in Dallas is between 11:30 Sunday night and 12:30 AM Monday morning CST.

Mir was loud and strong about 20 min after SPAR pass and that triggered
a few local POS reports from APRTRAK users who still had software set
for MIR (R0MIR) and not SPAR (W3EAX)

Ok people....don't know about you but APRTrak seemed to work kind of, just no
SPRE! R0MIR was digi'ing a WHOLE BUNCH of stations and filled up my map, I know
that I copied much much more than just one page.

Can anyone please explain to me exactly how to do the Kep's part of APRTrak. I
read Bob's message but I guess I just do not understand it.

> on APRTRAK.

WB4APR REPLY COMMENT:

There is only one SPRE.bk. And it is useless in APRS, since APRS cannot
decode the telemetry.

>n2czf@gate.net
>Jupiter Farms Florida

Dear Rich:
I found the best way (for me) to configure the KEP'S in APRtrak was to delete all nine (9) satellites from the APR.ORB file and just copy in the KEP'S for STS-72 in AMSAT format. This eliminates a lot of clutter caused by the other, unneeded, satellites. You might also want to add MIR to the APR.ORB file. After the SPRE experiment is over you can put the original nine (9) satellites back in the APR.ORB file.

I heard packet signals might be of SPRE on 145.55MHz
on Jan. 14 from 15:29z to 15:33z.
Unfortunately, Not decoded. Thus, I couldn't confirm they are of SPRE.
No passes of Mir durting this time.
I'll try again on next pass.

The time meets with predicted time as follows keps.

```
SPARTAN
1 23763U 96001B   96014.50990802  .00025480  00000-0  75964-4 0  9501

374. STS-72/SPRE pass over Hawaii

From: DDOBBINS@aol.com
Date: Sun, 14 Jan 1996 11:57:09 -0500
To: APRSSIG@tapr.org
Message-ID: <960114115708_116140010@mail06.mail.aol.com>
Rendered body type: text/plain

Copied the following sentence at 0136 Hawaii time (1136Z):
W3EAX>WORLD/V:GPS_LOCATION 01:36:427 44413000001003

Now for the rest of the story: I don't have DOS here at home. Mac did not log the station heard. The line above was posted at the bottom of my world.map I was viewing at the time. Not listed in history file either.

A few moments ago, just before sunrise, at 0625 Hawaii time (1625Z), I visually spotted what I'm sure was STS-72 on an ascending pass (SW to NE), nice and high in the sky. A moment later I observed another object cross the sky, possibly SPRE, but on a slightly different orbit, flatter than STS-72, and not quite as bright. Nothing heard from SPRE on this pass.

One of the schools here is a ground control station, and I'll report back if they got anything.

Aloha for now. Too early for the beach here, sun's not even up yet, so I'll just have a cup of Kona coffee. Dave.

376. More SPRE-APRtrak/APRS notes

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 14 Jan 1996 12:09:28 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960114120649.722A-100000@greatlakes>
Rendered body type: text/plain

Here is an explaination of some details of APRtrak/APRS:

```
SPACE MODE:  Enables parsing of grid squares in the TO field. (GRID-IN-TO)
             Puts YOUR gridsquare in your TNC TO field.
             ARMS the program to reset its POSIT/BCN timers when it
                  hears a packet from the space DIGIpeater.
             Toggle it on and off with alt-S-MODES-SPACE command

ARMED:       Shows you that SPACE mode is set and awaiting a pass

SUCCESS:     In SPACE mode, shows that your XMTed packet was seen.
             Resets your POSIT/BCN timers to max (9 minutes)
             DISABLES ARMED mode for 9 minutes, then restores
                      ARMED mode after the pass is over
```

NOTE: APRtrak defaults to always monitor for GRID-IN-TO packets, but APRS does NOT. If you are NOT in SPACE mode in APRS, then you will NOT plot the position of packets, since it will ignore packet not sent *TO* APRS. To override this, in APRS, toggle on CONTROLS-FILTERS-GrdTO. This will let you receive GRID-IN-TO packets but your TNC will not be configured to XMT them.

```
GRID-IN-BCN:   This MODE places your gridsquare preceeded with an "@" and
               ending with a "]" in both your POSIT and your BEACON.
               ALL versions of APRS will always decode this packet, but
               it is not as SHORT as the GRID-IN-TO format.
```

```
Hope this helps...
```

380. Earlier report not SPRE?

From: DDOBBINS@aol.com
Date: Sun, 14 Jan 1996 12:36:13 -0500
To: aprssig@tapr.org
Message-ID: <960114123612_41386825@mail02.mail.aol.com>
Rendered body type: text/plain

Been an hour since I posted msg ref SPRE/STS-72 visual sighting over Hawaii. Am wondering if what I observed one hour ago (vice 90 mins ago) was another space object (or two). I don't have a tracking program on my Mac. At 0725

```
(1725Z) just heard SPRE telemetry. Got several successful digis thru W3EAX,
so perhaps I'm logged on the system. What'll that get me? A free cup of Kona
coffee??? Signals only lasted about two mins. Will listen again about 0900.
Still no report from the school doing the ground station telemetry relay to
UofM over internet. Sun just came up here, going to be (another) lovely day
here. Aloha, Dave.
```

Hate to be a "me too" but I just got a Magnavox 4200 unit as well (probably
from the same source as Bob).  The unit arrived, but the promised documentation
hasn't shown up yet.  Any pointers would be appreciated -- I understand the
Magnavox GPS line has been taken over by Leica, but I don't have any info on
how to reach them.

WB4APR REPLY COMMENT:

A warm feeling.  Especially in hawaii.  SPRE keeps no record, so
everyone, save EVERY APRS packet and forward to me.  Actually, Im only
going to collect ONE posit per station, so all I need is the POSIT
beacon.   BUT, do add up some statistices and forward them also...
Save ALL SPRE data thoug, in case SPRE neede
s it.

What I would eventually like to put together is a SPRE-W.BK, SPRE-TX.bk
```

and a SPRE-E.bk. So someone in each of those areas could accumulate all posits recorded and send them in...

384. First APRtrak SPRE Posit!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 14 Jan 1996 14:03:38 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960114135722.924A-100000@greatlakes>
Rendered body type: text/plain

JJ1WTK reports that JG1KOE copied APRS posit from BV1AF in grid square PL04VQ.

BUG! When I used the OPS-FIND-[PL04VQ command I found that the LAT was 4401.10 but the LONG was 21407.40W. Its in the right place, but it is beyond the date line and should actualy be plotted in EAST longitude.

So SUBTRACT the 21407.40W from 360 and you get 14552.60E and that puts him on the north coast of Saporro!

This bug is proabably in all versions of APRS too. Sorry to you EASTern hemisphere folks..

Rendered body type: text/plain

I just got the latest from KB4XF. His latest version of MKMAPHK2 I have renamed to MK100v20.zip to allow room for more version numbers. Again, it will not KERMIT to my FTP site, so I am posting it on 410 280-2503. First person that gets it an FTPS it, let us know. Here is what Jack says about this new version:

Make Map Hundred Kbyte CD Version 2.0   mk100v20.EXE   27 Dec 95

New features added in this version

- A default map data sub-directory name of c:\dlg has been created

- The code now handles either 82 byte blocked records from the CD or 80 byte unblocked records from the USGS ftp site. ('Blocked' means a carriage return and line feed are added to the end of each record or line of data or card image)

- The code now permits 1,4 or 9 maps centered about the user's input coordinates to be produced in a single session. Pauses in the code (Hit any key to continue) are eliminated when 4 or 9 maps are being produced.

- The user's map radius of 1, 2, 4, 8 etc nautical miles is automatically increased by five percent so that adjacent maps will overlap and APRS will use the map as soon as possible.

- Shore lines and river banks are decimated by writing to disk only every other point. This worked well with the 2 Mbyte maps as there are more points per inch in the hydrographic files than in the road files.

- The progress line at the top of the screen now shows what map is being made.

- An error message that is issued when no map file can be found for the desired map has been expanded to show the four corners of the last USGS map file examined and the user's map center coordinates and map radius.

Thoughts on any future Version 3

- The multi-map production feature could be expanded to include 16 or 25 maps at once. However, drawing little boxes on the input screen is tedious, boring and not much fun. Does anyone have any ideas on how to identify each map when making this many at a time?

- There are one or two bugs that cause a line segment to be missed now and then. If I transport this code to a faster machine (my wife's) I may be able to find and fix them.

- I am still wary of how this code will perform in regions with extensive shorelines such as tidewater Virginia or Lousiana bayous. I need user feedback on this.

- No Windows support is planned. Anyone skilled in Visual Basic or Visual C is more than welcome to take a crack at this.

- If there is an overwhelming need for railroads, canals, trails, etc, a switch could be added.

Jack Cavanagh, KB4XF
Falmouth, VA

Rendered body type: text/plain

Ok I am giving APRS /Space mode a try tonight.
I did an <alt> S   and selected space mode.
My beacon is off
unproto is W3EAX
mxmit is off
I zeroed files
loaded MIR.bk
changed freq. to 145.55 on a low G6 hustler at rooftop level.

Did I forget anything?

Can I again hit files zero to get rid of the positions showing on my screen or perhaps delet them??? How much of the mir.bk file is really needed to arm the program. It would be nice to start with a clean positions menu and screen. thank you Charles

WB4APR REPLY COMMENT:

There is no reason to load MIR.BK. It was just an old sample file.
Only if you are running APRtrak do you load SPRE.BK. This is to tell
APRtrak to activate the special telemetry equations for SPRE's unique format.

Normal APRS does NOT know how to decode the unique SPRE telemetry.

389. Plotting SPRE posits

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 14 Jan 1996 17:59:43 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960114175127.1580C-100000@greatlakes>
Rendered body type: text/plain

If you saved raw SPRE packets to a text file, there is no direct way to
plot them on the APRtrak/APRS maps. But it is relatively easy to put
them there yourself.

1) Do an OPS-FIND-[gggggg to have APRtrak/APRS move the cursor to that
   grid square
2) Next do an INPUT-ADD at that location and enter the station CALLSIGN

EASTERN HEMISPHERE: If step (1) puts you at a LONGITUDE greater than 180
degrees, then subtract the LONGITUDE from 360 and when you do step (2)
simply enter the DIFFERENCE as longitude EAST. Remember you are
subtracting degrees and minutes...

390. SPRE telemetry time

From: kc5ejk@onramp.net (Robert Winingham)
Date: Sun, 14 Jan 1996 17:05:06 -0600
To: aprssig@tapr.org
Message-ID: <v02130500ad1f39120bbd@[199.1.11.129]>
Rendered body type: text/plain

Is the time reported in the telemetry UTC (The GPS time) ?
I thought it was but the report from Hawaii has it in local time.

Did a APRtrak cause the logged time to be different ???

```
----------------
>> Copied the following sentence at 0136 Hawaii time (1136Z):
> >W3EAX>WORLD/V:GPS_LOCATION 01:36:427 44413000001003
-----------------
```

Was this an E-mail error or is the SPAR so smart it know
the local time under it :-)

Also is this the only Four telemetry formats ???

```
--------------- Data from earlier post -------------
W3EAX>WORLD:REFLEX 01:17:36>AA55800000000000000000000000000000000000000000000000
W3EAX>WORLD:SPRE_TELEM 01:17:57>00:8B 01:9A 02:00 03:9B 04:00 05:CF 06:00 07:ABC
W3EAX>WORLD:GPS_TIME 01:17:48>414759DF130344413000001003
W3EAX>WORLD:GPS_LOCATION 01:17:26>83414773605845C9D341551D31EC81FE6641404B83ED33
-----------------------------------------------------
```

The output data rate for each format seems different. ie time is each
frame is not greater than the last.

If we just sort the data from all over the world by telemetry time the
data set relation is lost.

391. APRtrak/APRS Grid bug!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 14 Jan 1996 18:26:08 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org

Message-ID: <Pine.SUN.3.91.960114181348.1774B-100000@greatlakes>
Rendered body type: text/plain

```
I thought there was something fishy about a BV1AF being on the northern
coast of Hokaido.  When I moved my cursor to Hokaido  and used the
MAPS-PLOTS-GRIDSQ command I got a different GRID!  Then I  hunted with
the cursor and the MAPS-PLOTS-GRID command and located the CORRECT
position for PL04vq as being on the North East coast of Tiawan!

The MAPS-PLOTS-GRID command has always worked correctly.  Apparently
running through the same routine in reverse with the OPS-FIND command
DOES NOT WORK for EAST longitudes...  SOrry

So my last message that said simply subtract the long from 360 does NOT
give the right answer either...  Ill fix APRtrak tonight an post a
revised version by 1700z on the 15th.  In the mean time, for EAST
longitudes you will have to move the cursor and hit MAPS-PLOTS-GRID until
you find the location of the grid.
```

I found the SOP95xx.ZIP files through the spacelink FTP site:

    spacelink.msfc.nasa.gov

you can find it on the WEB as http://spacelink.msfc.nasa.gov

The files are five levels deep in directories, as follows:

     Instructional.Materials
       Software
         IBM.PC
           Satellite.Tracking
             STSOrbit.Plus

You will need all the files in that last directory - If I remember right,
there are six of them. The most recent version of the STSPlus program is
9548.

The files are also obtainable from:

     RPV Astronomy BBS

     (310) 541-7299

     Regards, Claude
              K5DTN

Keith,

Will MacAPRS support these modes? I am not aware of it but thought that
because of the parallel developnet of APRS/MacAPRS/WinAPRS it probably should.

Just asking,

Bruce, KQ4TV

Dave Ransom's superb satellite orbit simulator, STSORBIT PLUS, can be found on the net at:

http://spacelink.msfc.nasa.gov/Instructional.Materials/Software/IBM.PC/

The latest files are sop9548a.zip, sop9848b.zip, and earth3.zip. The current keps are at:

http://spacelink.msfc.nasa.gov/Instructional.Materials/Software/Tracking.Ele
ments/

The software is DOS based for a 386 or better processor with a math co-processor. It is fully functional and he only asks for a $10 donation. This program is the best example of graphics based DOS programing that I have ever seen and is very well behaved when run in a win3.1 or win95 full screen dos window. Compare this to some crippled shareware programs with registration fees of 2 to 4 times as much.

Dave's RPV ASTRONOMY BBS is at (310) 541-7299 @ 2400-14400 Baud.

It worked! But I forgot to load the SPRE.BK file, so I didnt decode any telemetry this first pass... Dont load it after you are into the pass unless you do a FILE-SAVE first or you will loose what you have. Here is the BACKUP file for this pass. One full page of contacts in the SOutheast...

Please, if you are going to post a BACKUP file like this one, edit out ALL LOCALS that were not VIA W3EAX and also all of the lines from the "a" page. Remember to edit the locals out of the "l","p" and "h" pages too.

> >
>
> Please elaborate what you mean.  WX beacon reporting rate?  Over VHF, HF?
>
> Position reports from fixed stations (rate controlled by APRS program)
>
> or Mobile GPS reports?
>

I mean position reports from fixed stations, in the SF Bay area.  Most of the
traffic is beacons from fixed stations with periods of five minutes or less.
It may not be so bad as to actually "bog down" APRS in this area yet, but they
are the vast majority of packets, and set a bad example for new users.

It would be more interesting to see more incomming WX, HF, and mobile traffic.

Once in a while, I see a "mobile" GPS station which is parked
somewhere. Sending out the same position report once a minute to
WIDE,GATE,GATE,WIDE. I assume this is not helping anyone.

Perhaps the APRS program could detect that your position has not changed from
the last beacon, and reduce the reporting rate.  This would help for fixed and
"mobile" stations.

Chuck

OK,  11 more stations on that pass for a total reported of 27 so far today.
Here is what it looked like from way up north (40 deg latitude) 7 deg pass.

DO NOT ATTEMPT TO CONNECT TO SPRE. PLEASE!  THAT REQUEST CAME FROM SPRE
CONTROL.

Here is the pass with the "a" page and locals edited out...

Here is RAW logged data from the TNC in " PASSALL ON" mode.
Monday Morning 12:35 AM CST - 11 Deg pass. using Omni. Strong signal !!
As the Passall was on there are a few data errors.
I think I editted out all the LOCAL packets.
Next pass I'll use APRTrak on my MAC

```

408. APRtrak E.long OK!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 15 Jan 1996 02:23:47 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960115021358.2718C-100000@greatlakes>
Rendered body type: text/plain

I was wrong when I said I was wrong!

Both APRtrak and APRS *do* properly plot the posit of EAST Longitude grid squares heard on-the-air. I went to fix it, and it wasn't broke.

The only thing wrong was that the OPS-FIND-[gridsq command does *not*

```
work for finding East longitude gridsquares in APRS.  It DOES work
correctly in APRtrak.

One other observation.  Usually APRS and APRtrak will always plot a
position of a station with a grid square in his BEACON text if the beacon
is in any of the following formats: [FM19sx], @FM19sx], or /FM19sx] and
they are the first characters of the BText.  But we just observed that
when you are in SPACE mode and the Grid Square is being sent in the TO
FIELD, then neither program will look for a GRID-SQ in the BText.

If you are in SPACE mode, and someone sends a normal packet with the
gridsquare only in the BTExt, then he will show only on the LATEST list
and you will have to do an OPS-FIND-[gridsq to see where to put him...
```

I suspect we are talking about two completely different things.  What is the
"POP" to which you refer? A specific computer program?  Perhaps you could
e-mail me a description of what it does.  We seem to be drifting a bit away
from APRS.

Chuck

WB4APR REPLY COMMENT:

APRS has always done this.  If your posit remains within the 80 yard
SA filter, then your posit DECAYS.  But that is only if the mobile is
running APRS.  Many mobiles are stand-alone-trackers.  The TNC itself
```

would have to implement that algorithm in that case...

Rendered body type: text/plain

```
One final observation.  We found that if you set Mcom ON in APRtrak, then
APRtrak will NOT be able to decode the telemetry.  Now that I think about
it, you dont need Mcom ON anyway.  That is so you can see DISCONNECT-BUSY
and other NON UI frames.  There shouldnt be any CONNECTED protocol on this
mission, so leave Mcom OFF.
```

Great.  Nice to hear about this feature.  Wish more people (fixed and mobile
stations) used it, rather than worked around it.

Chuck
```

Nothing heard on 2:15 CST (08:15 UTC) pass or the 3:50 CST (09:50UTC)
pass in Dallas and these were to be the best of the day.

Lets hope it was turned off as the Boys were outside in the cargo-bay
for those two passes.

> >

Sending in a request and getting an immediate response is a mode I envisioned, which would make it POP-like as I understand it. But I don't think that really solves any problems over any other method.

I am not suggesting that e-mail containing postion reports be automatically gatewayed onto APRS when received. The e-mail positions could automatically be added to an object list in APRS and displayed, but the APRS operator has to push a button (or something) after approving the message(s), then a transmission could take place. If the e-mail is delivered via SMTP or POP or any other way doesn't really seem to matter to me. The key is the ham must decide that the message is ok to tramsmit, and trigger the transmission.

My understanding is that you can not write a program that would automatically periodically request e-mail from somewhere and then transmit it via APRS, even if it is only APRS format position reports.

Automatically restricting the transmission to APRS format position reports does not give nearly enough control to meet legal requirements on message content. Imagine a string of position reports which positions icons on your map in such a way as to spell out obscenities or even draw low resolution images on your map!

Non-hams can still still report positions. In fact they could send in false positions of legitimate hams. Any user could flood the system with a huge volume of various position reports making it totally useless for everyone.

Security wise, it would be wide open. You couldn't trust it for anything. Everything could be forged or faked, but it would still be an interesting internet experiment. Transmitting part of the results onto APRS at the discretion of APRS operators could be useful and interesting if handled carefully. But that wouldn't be my problem.... :-)

420. SPRE is working

From: deang@MAIL.SYNTRON.COM
Date: Mon, 15 Jan 96 06:44:52 CST
To: aprssig@tapr.org
Message-ID: <9600158217.AA821717092@MAIL.SYNTRON.COM>
Rendered body type: text/plain

I just worked the first visiable SPRE pass from Katy, Tx. I copied lots of telemetry and was able to digi thru it with only 5 degrees elevation. I'm using 50w thru a 9dB vertical.

I copied the following digis... (Telemetry lines omited for clarity)

```
XE1KK>EK09KH,W3EAX*/1: <<UI>>:PSE QSL via xe1kk@amsat.org
XE1KK>EK09KH,W3EAX*/1: <<UI>>:PSE QSL via xe1kk@amsat.org
XE1KK>EK09KH,W3EAX*/1: <<UI>>:PSE QSL via xe1kk@amsat.org
KO4HD-2>EL95US,W3EAX*/1: <UI>:Steve 45W,6dBomni@20ft
KC5KGE>EL29CS,W3EAX*/1: <UI>:de George 50W Omni w/9dB
```

Good luck everybody. I'm getting ready for the next pass!

de George

At this time we have not heard from SPRE for a while. The command uplink was going just fine when all data stopped. Up until that time SPRE was working fantasically!

APRtrak seems to have been a success. When you get a chance we would be interested in your log and hst files.

On the 2nd pass over Katy, Tx SPRE was working GREAT. It was nice watching all the stations popup on my screen as it flew overhead. I listened on the next pass and heard NOTHING. I knew then that it had died a horrible death. Bad news for those who were waiting until tomorrow!

Here is what I copied on the first two passes... (without telemetry)

I attached my J List from my TNC. I checked my clock and it seems to be
on time. These times do not agree with the times that aprtrak and
Instant Track showed. Just wondering if others had these times. I did
not have the APRTRAK program running, I went to bed and got up at 2 AM.
I evidently missed the first pass. I turned computer off and went to
bed. Should have left it run! de Jack KB8DP in Marion, oh
```

432. Fixing up SPRE history files

From: w5rkn@amsat.org (Ronald G. Parsons)
Date: Mon, 15 Jan 1996 12:42:19 -0600
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <v02130500ad204f7e27c1@[204.181.160.1]>
Rendered body type: text/plain

```
Since the SPRE GPS was not getting correct data for its positions, I hand
edited my history files so the satellite plots when the history file is
run.

For example:

W3EAX     150035 @151622z1526.90N/00235.60ES Spartan SPRE/A=765843

becomes:

W3EAX     150035 @150635z2038.40N/10301.20WS Spartan SPRE/A=765843
```

I changed the UTC time and the lat/long. My times were CST. That lat/long were calculated at hh:mm:30 as the transmissions seemed to be in the moddle of the minute. Close enuf.

Ron W5RKN

433. SPRE Stuff

From: dwetzel@uswest.com
Date: Mon, 15 Jan 1996 12:22:58 -0600
To: aprssig@tapr.org
Message-ID: <0fa9fb40@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

Is circular polarization recommended for SPRE, and if so, what sense?

Disappointing results from 40.31N last night. No frames of any kind copied.

Doug
KC7CO

434. More SPRE

From: dwetzel@uswest.com
Date: Mon, 15 Jan 1996 13:05:21 -0600
To: aprssig@tapr.org
Message-ID: <0faa9700@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

Also, when is the SPARTAN payload going to be retrieved?

Doug
KC7CO

435. SPRE-APRtrak early results

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 15 Jan 1996 15:31:50 -0500 (EST)
To: aprssig@tapr.org, amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960115152001.6202B-100000@greatlakes>
Rendered body type: text/plain

The end of this message can be cut and loaded into APRtrak or APRS to see all of the POSITS reported via SPRE. THIS IS PRELIMINARY! It will not be reposted again until the FINAL report. Sorry for the bandwidth..

SPRE was activated at about 1312z on the 14th over the Pacific. The first POSIT (from Taiwan) was reported at 1530z in Japan. Packets were reported from Hawaii at 1725z but no other reports have been received from Asia over to Europe. Monday morning at 0330z, 6 POSITS were heard in Florida followed by 11 more at 0505z, and then 38 more at 0640z extending from Vermont to Arizona and Chicago. SPRE has not been heard since about 0730z after it received a command uplink from a station in Austrailia. SPRE was scheduled to remain on until about 1100z on the 16th. Keep listening...

If you have confirmed POSITS that were *known* to be digipeated by W3EAX send them to me and I will add to the following file. Please send the POSIT as it appears on the P-LIST. Thanks. Some BEACONS were edited to make them fit the 80 char line.

437. SPRE

From: Larry Griffin <largriff@onramp.net>
Date: Mon, 15 Jan 1996 16:15:53 -0600
To: "'aprssig@tapr.org'" <aprssig@tapr.org>
Message-ID: <01BAE364.C39EA9E0@lub13.onramp.net>
Rendered body type: text/plain

I can't believe it...
I'm dumb...
I'm stupid...

I practiced all week with APRtrak...

I painstakingly setup APRtrak Sunday night and went to bed...

Got up Monday morning...

I had forgotten to turn the blasted radio on!   ARRRRGGGGHHHHH!!!

Larry Griffin <largriff@onramp.net> - BOWING FOR APPLAUSE

P.S. See, no matter how bad you think you have it, there's always
      someone else who is worse off! Today, I am that person!

438. Tech Project/Quiz for the Sig

From: n2czf@gate.net
Date: Mon, 15 Jan 1996 18:12:46 -0500
To: aprssig@tapr.org
Message-ID: <199601152312.SAA26278@osceola.gate.net>
Rendered body type: text/plain

Ok now with more and more areas interested in seting up multiple GATES I have a brain teaser for everyone to ponder and try. Post all messages to the sig and not just personal mail this way everyone can participate in a group.

Example : Station with SEPERATE radios for 80M, 40M, 20M, 30M, 17M, and 6M and one 2 meter. This station just "happens to own" 6 TNC's that can GATEWAY and is willing to dedicate all radios to APRS. Having gone bankrupt buying 6 GATE compatable TNC's and a "few more" HF radios to the project our friend "Joe" cannot afford to buy anymore 2M radios for 145.79. Joe can't even afford dinner tonight let alone 5 more 2M antennas to attach to the radios! How can Joe put all of his brand new equipment on the air as a GATEWAY with 1 VHF radio ??

We can probably get away with a bunch of connectors in a box with some good filtering techniques and diodes to prevent the PTT to "cross key" the HF radios. Also some more diodes and capacitors in the audio line to prevent the audio of one TNC going to all, but this can lead to many other different problems. We are now talking about 6!! different bands, if there is just a little activity on each and the normal ammount on 30M this would lead to A LOT of potential conflicts (traffic jam on RX and PTT).

Anyone have any ideas or food for thought ?? I myself have the problem with only

2 HF bands, some others are also in the same boat. Soon I can add 6M to the list and I am sure some soul out there will try for more bands as APRS grows. The idea of 3 antennas for 145.79 does not interest me and the idea of 2 more VHF radios, 1 to replace my HT on 30, one for 6M when it comes and my other one on 80M is not too appealing.

It sure would be nice if some of these node code writers would sit up and listen so standard TNC's could be used as in a NODE STACK, and only 1 radio would be needed per band with the TNC's connected in a diode matrix!

Rendered body type: text/plain

Just a quick note to tell people posting the RAW SPRE data that the
transmitted data format is longer than 80 characters.
Several of the reports (Mine included) were truncated.
The GPS location will not plot during post processing and telemetry is also cut short.

Open your mail reader WIDE for this: About 116 positions should do it and use a mono-spaced font

```
In JA, We had several passes of SPRE 1430z thru 2030z on 15th.
But nothing heard.

I'm very sorry, but I enjoyed it much on the birthday.
I had the many reception logs of SPRE from over 10 of JA hams.

BTW, is there ant next plan of SPRE onboard ?

>
>SHUTTLE ASTRONAUTS TO SPEAK WITH STUDENTS
>VIA AMATEUR RADIO
>
>Amateur (or "ham") Radio operators from around the world will point their
>antennas at the sky during the upcoming shuttle mission, STS-76. Many of
>them hope to make radio contact with the astronauts aboard the Space
>Shuttle Atlantis. And, some of these amateurs have volunteered to assist
>student groups that have prepared questions to ask the astronauts via the
>ham radio airwaves. The project is called the Shuttle Amateur Radio
>EXperiment, or SAREX.
>
>The astronauts will use a radio aboard the shuttle, on frequencies used by
>ham radio operators, to talk directly with large groups of students.
>They'll demonstrate to young people, teachers, parents and communities how
>Amateur Radio energizes students about science, technology, and learning.
>
>To operate Amateur Radio from the space shuttle, one or more of the
>astronauts needs to have an Amateur Radio license. Astronaut Richard A.
>Searfoss will serve as the shuttle's Pilot, and has Amateur Radio call sign
>KC5CKM. Searfoss last operated SAREX from the Space Shuttle Columbia during
>mission STS-58 in October/November 1993. This will be his second shuttle
>flight. Linda M. Godwin is N5RAX, and will serve as a Mission Specialist.
>Her third shuttle flight, Godwin used ham radio aboard the shuttle Atlantis
>during STS-37 in April 1991, and from aboard Endeavour during STS-59 in
>April 1994. Ronald M. Sega is KC5ETH, and is also a Mission Specialist.
>Sega used SAREX from Discovery during the first joint US/Russian shuttle
>mission, STS-60, in February 1994. The remaining crew members include
>Commander Kevin P. Chilton, and Mission Specialists Shannon W. Lucid and
>Michael R. Clifford.
>
>During the mission, the shuttle will rendezvous and dock with the Russian
>Space Station Mir. Later, the shuttle will return to Earth, leaving Shannon
>Lucid with Mir for a 5 month stay aboard the Russian complex.
>
>Amateur Radio has been flying aboard the shuttles since 1983.
>
>WHEN: Launch is scheduled for March 21, 1996 at 0834 UTC (3:34 AM EST) from
>the Kennedy Space Center, Cape Canaveral, Florida. Landing is scheduled for
>March 30, 1995 at 1707 UTC (12:07 AM EST) at the Kennedy Space Center,
>Florida. 9 day mission.
>
>WHERE: The launch will place the shuttle into Earth orbit at an altitude of
>196-245 statute miles (315-394 km) and an inclination of 51.6 degrees.
>
>WHY: NASA's intent in making astronauts available for SAREX operations is
```

```
>to involve the largest possible numbers of people, particularly students,
>in technology and the US space program with the help of Amateur Radio.
>
>During SAREX missions, the astronauts will typically make the following
>types of Amateur Radio contacts:
>     Scheduled radio contacts with schools.
>     Random radio contacts with the Amateur Radio community.
>     Personal contacts with the astronauts' families.
>
>CREW MEMBERS (and Amateur Radio call signs):
>     Kevin P. Chilton, Commander
>     Richard A. Searfoss, Pilot, KC5CKM
>     Shannon W. Lucid, Mission Specialist, call sign To Be Determined
>     Linda M. Godwin, Mission Specialist, N5RAX
>     Michael R. Clifford, Mission Specialist
>     Ronald M. Sega, Mission Specialist, KC5ETH
>
>PAYLOAD: Primary Payload--
>During the STS-76 mission, the Space Shuttle Atlantis makes its third trip
>to the Russian Space Station Mir. This is the third of seven shuttle
>flights to Mir, an effort known as Phase 1--the precursor to building the
>International Space Station.
>
>Additional STS-76 mission information can be obtained from NASA:
>     * NASA Spacelink computer information system (look under
>Spacelink.Hot.Topics)
>          BBS: (205) 895-0028 [VT-100, 8-N-1]
>          Telnet, FTP, and Gopher: spacelink.msfc.nasa.gov
>          World Wide Web: http://spacelink.msfc.nasa.gov
>          Internet TCP/IP address: 192.149.89.61
>     * NASA Shuttle World Wide Web Home Page: http://shuttle.nasa.gov
>
>SAREX SPONSORS: The Shuttle Amateur Radio EXperiment (SAREX) is sponsored
>by the American Radio Relay League (ARRL), The Radio Amateur Satellite
>Corporation (AMSAT) and The National Aeronautics and Space Administration
>(NASA). SAREX is supported by the Federal Communications Commission (FCC).
>
>PARTICIPATING SCHOOLS: A handful of schools are selected from around the
>world to make contact with the shuttle during most SAREX missions. These
>contacts are prearranged, giving the schools a greater chance at making a
>successful contact. Two or more students at each of the selected schools
>ask questions of the astronauts during the contact. The nature of these
>contacts embodies the primary goal of SAREX--to excite students' interest
>in learning.
>
>The following schools have been selected by the SAREX Working Group for a
>scheduled radio contact during this mission:
>
>Artesia Public Schools
>Artesia, NM
>
>Troy Middle School
>Troy, TX
>
>S.J. Davis Middle School
>San Antonio, TX
>
>Bethlehem Central Senior High School
>Delmar, NY
>
>University of Colorado
>(College of Engineering and Applied Science)
>Colorado Springs, CO
>
>
>ADDITIONAL INFORMATION FOR AMATEUR RADIO OPERATORS-
>
>SAREX RADIO FREQUENCIES: During most SAREX missions, many of the crew
>members will make random contacts with earth-bound hams. They make these
>contacts during their breaks, before and after meal time, and during their
>pre-sleep time. In fact, over the past years the astronauts have contacted
>thousands of amateurs around the world.
>
>Since this flight is a shuttle-Mir docking mission, and SAREX and Mir
>Amateur Radio stations usually share the same downlink frequency (145.55
>MHz), the SAREX Working Group has decided to use the following frequencies
>during this mission.
>
>The crew will use separate receive and transmit frequencies. PLEASE do not
```

```
>transmit on the shuttle's DOWNLINK frequency. The DOWNLINK is your
>receiving frequency. The UPLINK is your transmitting frequency.
>
>     FM Voice Downlink: 145.84 MHz
>     FM Voice Uplink: 144.45, 144.47 MHz
>
>The crew will not favor either uplink frequency, so your ability to
>communicate with SAREX will be the "luck of the draw." Transmit only when
>the shuttle is within range of your station, and when the shuttle's station
>is on-the-air.
>
>CALL SIGNS: FM voice call signs--KC5CKM, N5RAX, KC5ETH
>
>QSL VIA: Send reports and QSLs to ARRL EAD, STS-76 QSL, 225 Main Street,
>Newington, CT 06111-1494, USA. Include the following information in your
>QSL or report: STS-76, date, time in UTC, frequency and mode. In addition,
>you must also include a SASE using a large, business-sized envelope if you
>wish to receive a card. The Nashoba Valley Amateur Radio Club in
>Massachusetts has generously volunteered to manage the cards for this
>mission.
>
>SHUTTLE TRACKING: Current Keplerian elements to track the shuttle are
>available from the following sources:

> But nothing heard.

It seems that SPRE went off the air while we were comminicating with it.
Not sure why.  It was working perfectly until is just stopped.  It
happend over one of our control stations, so we have performance data
when it occured.

>
> I'm very sorry, but I enjoyed it much on the birthday.

HAPPY BIRTHDAT!!!!  :)

> I had the many reception logs of SPRE from over 10 of JA hams.

We really appreciared the e-mail with the data!  It was very timely.  Job
well done!

> BTW, is there ant next plan of SPRE onboard ?

It is uncertain at this point.  It currently is not scheduled, however,
there has been some talk about it.  We will certainly let you know.

Message-ID: <Pine.SUN.3.91.960115230228.8593D@greatlakes>
Rendered body type: text/plain

We need some more data before we call it quits on the APRtrak project...

1) We need to know approximately the success rate. In other words, how many other locals showed up on your P-LIST that were *properly* configured, but that did *not* get digipeated? Do not count any *human* errors, and aw-shucks attempts. To avoid duplication, send me privately the callsigns of anyone who "should" have been digipeated and their POWER/ANT info. Without knowing their power, it doesnt tell us much... Also be sure to include your LATITUDE so we know the slant range to the shuttle orbit. I think everyone I heard locally here made it. And we are at 40 lat...

2) Did ANYONE see a GPS posit from SPRE that was other than the Red Sea location that I captured? ALso, dont count the Wash DC posit for W3EAX which is always loaded with the SPRE.BK file...

Send to bruninga@nadn.navy.mil

Check the SPRE site for decode.c if you want to decode raw position
Data yourself.

 WWW Page: URL = http://w3eax.umd.edu
 FTP Site: URL = ftp://w3eax.umd.edu

```
/* -------------------------------------------------------------------- */
/*  decode.c  -- Decode SPRE messages
/*               See  SN_DecodeMessage below...
/* -------------------------------------------------------------------- */
/* -------------------------------------------------------------------- */
/* ProcessPosition -- Process the GPS position packet                   */
/* -------------------------------------------------------------------- */
/* -------------------------------------------------------------------- */
/* ProcessTelemetry -- Process the SPRE telemetry values
/*     5V = telem_value * (Vhi/256) * 1.5     (1.5/256 == 0.005859375)
/*    12V = telem_value * (Vhi/256) * 3.0     (3.0/256 == 0.01171875)
/* -------------------------------------------------------------------- */

I may be wrong, but I think the diode matrix would work fine here. The matrix is a passive system, not one controlled by the TNC's.

453. PK-232MBX problem

From: Bradley Ambers <brad@ecst.csuchico.edu>
Date: Tue, 16 Jan 1996 01:22:16 -0800
To: aprssig@tapr.org
Message-ID: <30FB6E48.265B@ecst.csuchico.edu>
Rendered body type: text/plain

Well I have a good one here. I have used my PK232MBX in that past without any problems on APRS, but just resently it stopped reading the digi. The the best part is that I can copy my neighbor across town directly. I can see the DIGI transmitting info but the APRS programs is not printing it to the location, position or any other part of the aprs program. The signals are great full scale from the digi. I have never had this problem before. My neighbor across town reads the digi just fine. Any suggestions.

Thanks in advance

Brad

Message-ID: <199601161356.FAA21700@ix12.ix.netcom.com>
Rendered body type: text/plain

In reply to the sig participants that have Magnavox GPS Engines, I have an old Magnavox MX4200, 6 Channel Receiver. It is about a 1990 vintage box. I don't know if it is the same or even similar to the Engines you all are talking about, but I have been using it as a mobile APRS GPS sensor for a couple of years now. It was one of the first mobile GPS's to be used for APRS here in the Central Ohio area. It has the B035 version of firmware and I have the PC-CDU software version 2.25 that permits observing and controlling the unit from a PC if desired. I also have the Technical Reference Manual, the PC Controller Users Guide and the Receiver Programmer's Guide. I would be happy to help, within the constraints of my available time, if this unit and information is applicable to what you have.

I am enjoying running APRS in Space mode. I should have read the
sig mail closer when this was discussed but,. Do I have it correct that
MIR does not want any one to beacon (fm06dp) there position via
R0MIR) ? I have enjoyed watching others connect to the pbbs, R0MIR-1.
I saw w3eax on a few passes! I shure wish R0MIR had a gps beacon, all
the time.

460. Mapmaking

From: ke4eer@ro.com (William Nolle)
Date: Tue, 16 Jan 1996 16:08:41
To: aprssig@tapr.org
Message-ID: <199601162217.QAA03686@sh1.ro.com>

Rendered body type: text/plain

I downloaded the new MK100v20.ZIP from the Annapolis BBS, I can't hardly believe there was nobody that D/L'ed that file that could have uploaded it to Tapr so all can get to use it!. Anyway i will be uploading it to tapr sometime tonight. I did the 9 map grid of the center of Huntsville Alabama and it took only 10 minutes to produce the grid of maps,BUT the most exact center of the city map was all messed up when viewed. The program doesn't show you this when the map is being made of course. So whatever you do DON'T delete the *.DAT file untill you have viewed the result of each map. I did and had to undelete that map.dat file. The worst problem again is that the map ended up being 3205 points wich means you have to use the Scrunch funtion in Mapfix. This pesents another problem since it screwes up some of the roads by moving some points to a 45 degree angle. I have found over the many maps i have made not to use the scrunch function at all but rather delete some points outside the map area to bring the points down. Also on the last map of the 9 map grid the program crashed, but only at the point when the map was just completed, so it did save it. It would be great now if the Author would increase the grid option to more then 9 maps, or at least give the Lot/Lan center for the next 9 map grid. He did a great job and want to thank him again for making this software available for us crazy mapmakers Hi.

Yep, I agree the diode matrix will work as is right now as far as I can see. The cheap (inexpensive) MFJ-1274B can be used for HF with other TAPR-2 clones on the VHF side. Without the proper code I do not think the firmware would work considering we are using UI frames and not X1J or ROSE code in a connected state that knows where to send what packets along the serial "daisy chain". We are back to the part about I sure wish some of the node code writers would spend some time supporting APRS useage.

Forgot to mention for those who are using STS+ for tracking and haven't had the time to read the docs to use the switch /clk after the program name when opening the program. This will put it into a 43 or 60 line mode similiar to f7 on APRS. Also make a seperate icon and use the switch /clk /r after the program name to reenter the program at the same point as when you closed it. ie:

```
c:\path\stsplus.exe /clk   for initial setup.
c:\path\stsplus.exe /clk /r   for returning to the program on the same mission.
```

I used to use STS+ until I came across LogSat Professional for Windows. After working SPRE, I now swear by LogSat! You can open multiple windows with different projections. I had one orthographic projection showing the OAST position real-time, and another with a mercator projection running time accelerated displaying future passes.

LogSat uses the Windows multimedia features nicely. I would be sleeping on the couch and LogSat would wake me up with "3 minute warning ...". Then 3 minutes later it was "We have an acquired inbound satellite, bearing ... degrees." As soon as LogSat spoke these words, I was hearing SPRE! ..well, at least on the first two passes. Hi Hi

LogSat is a really nice tracking program and I look forward to running it along with the new WinAPRS. I believe a demo copy of LogSat can be found in the Ham forum on Compuserve.

Rendered body type: text/plain

TUESDAY, JANUARY 16, 1996. According to Vikki Gigante-Hueber, KA3PVS, Goddard ARC Space Shuttle Retransmissions Director, station WA3NAN resumed retransmitting space shuttle air-to-ground NASCOM audio today at about 1330 UTC.

Over the weekend snowplows cleared enough of the club grounds to make station access possible. This was the first time that the WA3NAN retransmission effort was down due to winter weather for so long. Vikki and the GARC volunteer control operators express appreciation to listeners for their patience during the period.

Vikki reminds listeners to tune in *only* during space shuttle crew awake periods, currently approximately 0030-1630 UTC during STS-72. The frequencies are 3860 kHz, 7185 kHz, 14.295 MHz, 21.395 MHz SSB (+/- QRM), and in the Washington, D.C./Maryland/northern Virginia/southeastern Pennsylvania area on 147.450 MHz FM. [QTH WA3NAN 38.9988N, -76.8469E, 50 meters AMSL.]

Further retransmission and other information can be obtained via telnet at wa3nan.gsfc.nasa.gov as well as via packet radio wormhole to the WA3NAN BBS through the JPL node and other nodes. Reports can be sent to Vikki at ka3pvs@wa3nan.gsfc.nasa.gov or to the WA3NAN callbook address.

If you're a Linux/UNIX user running X11, check out SatTrack:

http://www.primenet.com/~bester/sattrack.html

A freeware version (3.1) is available. It has all the usual graphics and some really nice features, including the ability to control your radios for doppler shift, control your tracking antennas, etc. All source code is provided. The program had so much commercial interest that the author decided to enhance it even more and sell it, but the 3.1 freeware version is still available, source and all. It can also alert you (with beeps, not with a voice) just before a satellite is about to come into or go out of range. VERY handy.

473. Questions re: Tech Project....

From: "Baker, Donn B   RV" <dbb4@PO7.RV.unisys.com>
Date: Wed, 17 Jan 96 10:59:00 CST
To: aprs-submit <aprssig@tapr.org>
Message-ID: <30FD2B9E@rsvl_gw.rsvl.unisys.com>
Rendered body type: text/plain

I've obviously missed something relative to Rich's (N2CZF) Tech Project.
Can someone explain WHY you'd want to gateway 5 HF bands plus 6m onto the 2m APRS channel ? I don't see what can be done by this other than to clog the 2m channel.

1) Assume 2m is 1200 baud, w/25% utilization (Yeah, we can argue about the utilization number)

```
2)  Assume 6m is 1200 baud, w/25% util
3)  Assume all HF bands (5) are 300 baud, w/20% util  (makes the numbers
easier to work)
4)  Five HF bands plus 6m gateway into 2m
5) Therefore, 2m TOTAL utilization is:
     2m util + 6m util + 5*(HF util) =
     300 bauds + 300 bauds + 5*(300*0.2) =

     900 bauds  or 75% of total channel capacity.
```

This load may be OK (not advisable, but OK) for unproto info (which APRS is, of course), BUT....

As soon as you try to use the channel for CONNECTED protocol (i.e., station to station messages), you have a 3 out of 4 chance that you'll get a collision, which causes a retransmit, which increases utilization, which increases the chance of a collision, which causes MORE retransmits, which FURTHER increases utilization, which ....

The net result is that the channel cascades into unusablility. BTW, a "good" rule of thumb for this type of channel (Carrier Sense Multiple Access w/Collision detection) is to maintain loading to less than about 50%.
  Everything works well upto 40%, and then starts to fall off. Much beyond 60%, nothing works well because of all the re-transmits.

Thats what I don't understand. It seems to me that the Project will simply make any VHF net it's connected to unusable. So why do it ? THATS what I don't understand.

Thanks for the help.

There is a nice article in the February 1996 issue of Scientific American on the US GPS system. The cover has a nice picture of one of the GPS satellites. Among other things, the article asks some rather pointed questions about why DOD is still bothering with Selective Availability when it is so easy to defeat! Recommended reading. The Russian GPS system is also mentioned, although briefly. The article points out that the Russian system does not use SA - just good position data!

>The most recent version of ROSE does support UI frames!
>
>I have added myself to this list, let's discuss what you are trying to do
>and see how well ROSE fits!

Tom.  Glad to see you here!

Most APRS beacons are meant to be seen by all stations between
the source and "destination", even if the beacon is digipeated several times.
The trouble with ROSE's UI implementation is that APRS can only
decode what comes out of the final switch.  If an APRS user wants to
communicate directly with another user at a specific switch using UI frames
ROSE's implementation *is* better because of the switch to switch acking
as compared to "long distance acking".

But for general APRS beacons, ROSE would work fine if just didn't have
the "one-hop digipeating" limit.

We used to have ROSE here in West Texas.  We converted 7 ROSE switches
back to TheNet simply because they couldn't digipeat more than one hop,
which cripples APRS.  There are a lot of people here who would like to
see ROSE back though.

If you could just make ROSE support multi-hop digipeating, like
TheNet/Netrom, we could make everybody happy (well most everybody)!

Even better, if you could make the "simple digi" function so that it
*only* digis unconnected frames, that avoids people making "digied
connections" i.e.. not ROSE, while still allowing multi-hop digied beacons, and
eliminating the "long distance ack" problem inherent in "digied connections".

P.S.  Should you decide to do this, we would ideally want to have up to
3 digi-only aliases which we could assign as CALL-SSID, WIDE, RELAY or
whatever.  It would also be nice if we could add a periodic beacon from the
switches themselves.

```
Just got a call from KE4XF that he found a bug in his multi-mapmaking
program MK100v20.EXE.  The OUTPUT file name MUST be 8 characters or it
will try to write a file with ....'s in it to fill the extra spaces, and
that will crash the prgram with an illegal file name...

This program extracts 1, 4 or 9 maps automatically from the 100K CD ROM
data all at once.

Also in the ZIP file is a HPPLOT or MAPPLOT (I forgot the name) which
will PLOT an APRS map on any HP compatible printer...

\>>FURTHER increases utilization, which ....

\>>Thanks for the help.
\>>Donn
\>>WA2VOI EN35ja

I do not know about in your area Donn but here in SFL I see very little if any connected traffic appearing on our APRS frequency. If you are sharing another frequency with connected traffic yes it would be a problem, if you have a lot of locals that connect to each other regularly then again yes you would have a problem.

APRS uses UI frames for all of it's transmissions so we do not need to worry about APRS causing problems with connects.

Why so many bands ?? Well different bands can serve different purposes for APRS. 80M seems to be doing well for Statewide communications, 40M would probably do better but QRM is bad. 30M has served well for 50% coverage of the country, anything past CO. from the East is just a occasional thing and the same from the West Coast. 20 or 17 M would do quite well for National and International coverage with 17M a primo choice for South and Central America. I have been told that there ARE stations on 17M packet that have APRS capability from South America, this was in the past week. Finally 6M is for curiosity, I think 6M would be GREAT as a propagation indicator as long as the stations were on continiously. The most important possibility for 6M is some long range links for WIDE digi's on 145.79. With 2 good locations and plenty of power 50 MHz is ideal for point to point communications, that is why paging companies used 72 MHz for quite a while from site to site. With several digi's on 2M linked via 6M all the digi's can hear the 1 wide packet and retransmit it in another area. Many will say well go WIDE,WIDE or WIDE,WIDE,WIDE ... this is not a good idea 2X WIDE OK and 3X WIDE is a no-no. If all of this can be done with plain ol' WIDE so much the better.
Here in FL we lack 2 things, Snow, no big deal, and MOUNTIANS! Mountians are a big deal if you are a ham, our flat terrain and overcrowded commercial tower systems give us very few good locations for free and when we do get one RF noise is so bad that it usually is not worth while. This is why we need a better system and are doing things a bit differently. We are lucky if we can get 40 miles from one digi to another let alone cover that area well for MOBILE APRS use.

481. ROSE-UI-and APRS

From: n2czf@gate.net
Date: Wed, 17 Jan 1996 19:06:34 -0500
To: aprssig@tapr.org
Message-ID: <199601180006.TAA16816@osceola.gate.net>
Rendered body type: text/plain

```
Last time we spoke Tom UI was incorporated in a beta version of the ROSE code
and we left of with the addressing of the UI frames in APRS and about having the
NODE able to send out a occasional beacon.

I forwarded some raw APRS data and some explanation on what the addresses were
trying to accomplish. Was any thought given to the address being a more verbose
format than the area code/exchange format? I am sure you do not want to
re-invent the wheel with ROSE code and I am sure that Bob/Keith/Marc do not want
to do the same with the APRS format so what are the limitations at this time
with what is at hand?

Simply a packet going to APRS VIA WIDE would need to be digi'ed out via the NODE
that hears the original packet AND have the ability to go out another TNC in the
stack on a different frequency (RE: 440 or 6M). Once heard by other stacks on
the "backbone" frequency it should be routed out their other TNC set to the
local APRS frequency.

I know that ROSE was created to reduce the amount of transmissions on packet so
BEACONS are not sent by the NODE, but in APRS we need that so we can plot the
digi. I am also sure that 1 transmission on frequency "A" causing a digi on freq
"A" and a signal on freq "B" that creates MORE transmissions on freq "A" at
other VARIOUS distant locations is not exactly what ROSE was created to do and
possibly somewhat against "RATS" views on packet, but that is what APRS really
needs to expand a network. I think that code like this will also reduce the urge
for stations to digi for example APRS VIA WIDE,WIDE,WIDE which is even worse
and being done now. APRS VIA WIDE would accomplish the same thing with less
packets on 1 frequency and better coverage. This can also possibly allow us to
switch to 9600 baud on 440 for the backbone operations.

>
REPLY

To: Charles Davidson

I spoke with a technical support rep and said that this was referring to
what formats you can import from.  In talking with her, this is the answer
we came up with:
 -To import your data, you must have a comma-separated text file (ASCII
```

format) containing either of two sets of information:
1. Latitude, Longitude, and Name
    -Latitude and longitude coordinates must be in decimal degree format,
not degrees, minutes, & seconds.

2. Name, address, city, state, and 9-digit zip code (in that order)
    -The software will ignore those records that do not include 9-digit zip
codes.

I hope this will answer your question, if you need further assistance feel
free to contact us here in Customer Service or our Technical Supprt Dept at
technical.support@procd.com.

Thanks for time!

Yes, I remember. Well... UI frames through ROSE works fine.

SWITCHes do not send beacons, yet. They could, but for now I am more interested in supporting the USERS as a primary point of interest.

>trying to accomplish. Was any thought given to the address being a more verb
>ose
>format than the area code/exchange format? I am sure you do not want to

I do not know what changing the addressing format could do to help.
ROSE is more a vehicle to pass the data between points.

Let's not worry about HOW the frame gets passed through the backbone.

So If the switch RX's a frame to APRS you want to to be TX'ed Locally and
forwarded to the other APRS channels.

The UI feature is going to be expanded to support multi-casting.
>
>I know that ROSE was created to reduce the amount of transmissions on packet
...

ROSE was created to provide full AX.25 features to User stations on a wide
scale basis.

I do believe that some simple changes can be made to make it work well with
APRS.

485. MK100v20

From: ke4eer@ro.com (William Nolle)
Date: Thu, 18 Jan 1996 02:47:16
To: aprssig@tapr.org
Message-ID: <199601180854.CAA10013@sh1.ro.com>
Rendered body type: text/plain

Bob someone told you there was an error or bug in the new software that it
must have 8 characters, i found that is not the case for me anyway!. But i did
find that in all cases the last map in the grid will crash the software and thus
to use the last map you have to use the DAT file. I also noticed that for many
maps (Altough only 1600 points) would mess up the whole map, so you would
also have to use the DAT file on these also. The only situation i found that
did not work with less then 8 characters was when using the -1 mile size it
would crash the software even tough there where only a couple of streets.
There's something realy flaky about this version but have not been able to
put my finger on it. In almost all cases when doing +1 mile maps it is useless
to use the new version, because if there's 1 map in that grid that has even
close to 3000 points it will crash. I also do not notice a change between
using the +1 or the 1 range detail. Also no railroads or streams where in any
of my maps. I think i will stick with the old version for a while, Gosh i have
to D/L it again now Hi.

By the way i did make a complete grid of 9 using only HUNT as a file name!,
don't forget the software adds 2 characters NW,NE,SE,SW etc if your doing
a grid of maps.

Rendered body type: text/plain

```
As a followup to my last message on the bugs in the new mapmaking software
i went back to MKMAPKKE and did the exact same maps over using it without
any problem even tough the map came out at 3014 points and it also had the
streams in it. Many times i like to do my maps without the streams and add
them later if the points allow. With MK100v20 you CANNOT make hydrography
maps only!!. I am used to having two directories, one for Roads etc, and one
for Lakes and Streams only, i tryid this with the new version and all it tells
you that no information for that area was found. I suggest that users try using
both MKMAPKKE then MK100v20 for the same highly populated area and see
which one will work the best, because for the City of Huntsville MK100v20
would not even work when choosing +.5 scale. (1/2 mile maps)

Larry Griffin wrote some stuff about Rose.

While we are rewriting digi code, consider this:

The digi should respond to the APRS query  ?APRS?  with its beacon text, or
other text containing its position.  Then the digis wouldn't have to
broadcast their positions as often.

I'd like to see this in *all* TNCs- not just nodes/switches

```
Six meters is used in the Cal/Nev/Ariz area for packet backbone.  I
     think the frequency is 51.12MHz at 4800 baud.  There's a machine at
     Big Bear, one at Potosi Mtn nr Las Vegas, one on Hualapai Mtn nr
     Kingman, one at Mingus Mtn nr Prescott, then I think another in the LA
     and PHX areas.  Appears to work pretty well.  I can't hear any of the
     links from my house, though, so I don't know the traffic levels.

     10m is heavily used by latin/south american hams for a packet bbs
     forwarding system.  The freq that I hear a lot of traffic on (during the
     day only, of course) is 28.180LSB, and I regularly hear Argentina,
     Columbia, Brazil, a few Mexicans and others.  All 1200 baud.  I've even
     connected to a few of the LUs with 10w and a dipole up 20 feet.  I have
     done some very minor experiments with 10m and have had little luck, but
     then I haven't used much for tx power or antenna.

     I'd be very interested in running some experiments on 28.185MHz LSB.  I
     have a Uniden and a 1200 baud TNC just sitting there.  When I get back home
     I will put it back on the air and let it brap out an APRS beacon.  The
     antenna will be a dipole oriented n-s (beam e-w).  If there's some interest
     generated, I'll even consider a 3-ele beam and more power.

     10m is interesting because a year or so ago a few of us experimented with
     meteor scatter on 10m and were VERY impressed with the preliminary results.
```

```
      We found that there were a significant amount of paths that stayed alive
     for many seconds.  This was all cw, however, and we didn't try running
     packet or any form of data.

     73 - Jon NW6H

Where can I find documentation that describes the various actions that
tnc's, digi's, etc CAN, MUST and Should NOT perform?

I would like to help support APRS on specific User Channels.

(I state it this way because it is very reasonable to have a wide area ROSE
 Network that has many different uses. The backbone just passed data with
 no regard as to which application created it...)

(I do see a switch stack that could have APRS Channel, BBS Forwarding
Channel, IP Channel and a couple of backbone channels...)

Hello,
I am wondering why I have not received any messages from this SIG
since 1/9/96. Has something changed? Do I need to re-subscribe? As far
as I know nothing has been changed on my end.

I would appreciate any help in fixing the problem, I miss my dailey
APRS fix! Please e-mail me direct...

Thanks,
Card Smith, N4FOR

>and see how well ROSE fits!

Tom. Glad to see you here!

Most APRS beacons are meant to be seen by all stations between
the source and "destination", even if the beacon is digipeated several times.
The trouble with ROSE's UI implementation is that APRS can only
decode what comes out of the final switch. If an APRS user wants to
communicate directly with another user at a specific switch using UI frames
ROSE's implementation *is* better because of the switch to switch acking
as compared to "long distance acking".

But for general APRS beacons, ROSE would work fine if it just didn't have
the "one-hop digipeating" limit.

We used to have ROSE here in West Texas. We converted 7 ROSE switches
back to TheNet simply because they couldn't digipeat more than one hop,
which cripples APRS. There are a lot of people here who would like to
see ROSE back though.

If you could just make ROSE support multi-hop digipeating, like
TheNet/Netrom, we could make everybody happy (well most everybody)!

Even better, if you could make the "simple digi" function so that it
only digis unconnected frames, that avoids people making "digied
connections" i.e.. not ROSE, while still allowing multi-hop digied beacons, and
eliminating the "long distance ack" problem inherent in "digied connections".

P.S. Should you decide to do this, we would ideally want to have up to

3 digi-only aliases which we could assign as CALL-SSID, WIDE, RELAY or whatever. It would also be nice if we could add a periodic beacon from the switches themselves.

I'm sure Bob Bruniniga WB4APR will respond to this one, as he knows the protocol best of anyone. I wish all TNC's would respond to the APRS Query, even if they arent nodes/switches/whatever. The AEA PK 12 doe it when in GPS mode, but I think that's the only one that does. Gwyn? Kantronics? Any response?

I've already started looking at this. PacComm TNCs may have one or both of the following features already which are quite similar to what is proposed.

UIBEACON ON|OFF When on and the TNC hears a UI frame with its MYCALL in the 'to' field, it will send a one time beacon of BTEXT via the UNPROTO path.

UILOCATION ON|OFF When on and the TNC hears a UI frame with its MYCALL in the 'to' field, it will send a one time LOCATION beacon of the contents of LTEXT via LPATH. Partially implemented in the PicoPacket are three additional buffer fields, L1TEXT, L2TEXT, and L3TEXT. If any of these fields are non-blank, they will also be send just as was LTEXT. (What I mean by partially implemented is that these three additional fields cannot yet be automatically filled with GPS strings.)

It appears that all is needed is to have a command UIAPRS which would work just like UILOCATION, but would be triggered when the letters APRS are seen. Danger here, if someone else sets up a regular transmission with the frame addressed to APRS, this TNC will react each time.

Hope I'm missing something about the APRS query that was mentioned.

Anyway, it should be fairly easy to do, but no promises yet.

Landing: 20-Jan-96 07:41:36 UTC

Note: These times and elevations are at the point of closest approach (peak elevation) for each city. ELSUN is the Sun's elevation for that city at that time. BOOM is the estimated length of time (MIN:SEC) after closest approach when the sonic boom may be heard. However, it is unlikely that the boom can be heard if peak elevation is less than about 20 deg.

Instead of hard coding one trigger and one response, why not make 1 or
2 generic commands that allows 1-6 chars user picked as a trigger and
a variable field with a variable path. Saves having to do it again when
someone else with their own "special" use asks for the same thing.
The variable text field could be manually filled by the user, or a
special code could be defined to look for GPS or WX data from some
source. Seems more flexible to me. my $.03.

WOW. I didn't remember seeing that stuff. What a good start.   I *think*
the APRS query has the format: ?APRS?. there is a lat/long and a radius
sent too. Can't remember who the addressee is, probably "APRS".

This is what triggers a pc running APRS to respond with its BTEXT (I think)
sometime in the next 2 minutes if it is within the distance range of the
station issuing the query.

If the ?APRS? query is addressed to a particular station insterd, then only
that station answers, sending its position (BTEXT).

I hope Bob will elaborate on this.

The information in the parentheses I added. I pulled the prgram using FTP
from SUNSITE... (in England) as mentioned above. It is a self extracting
program and did its thing quickly and with no problems. It is a pretty
impressive prgram, and having the voice announcements is a nice touch.

Pulling the program from England is pretty slow. It took about 45 minutes
last night. I do have it here now and would be happy to repost it to the SIG
or wherever. However, I'm not sure what the proper destination directory
would be. If someone will supply that information, I'll post LOGSAT51.EXE to
it. Thanks.

501. ROSE and APRS - Current and Future Abilities

From: "Tom Moulton" <tmoulton@ram.net>
Date: Fri, 19 Jan 96 15:10:58 EST
To: aprssig@tapr.org (aprs sig)
Message-ID: <15021573.2214@ram.net>
Rendered body type: text/plain

I have had a few discussions with some people on the list and
will now show what can be done with ROSE now.

Right now if you were to set your LPATH to

APRS via Switch_Call, ROSE_Address

As long as you can be heard by Switch your UI's would be routed
to the Point in the network that had the address 'ROSE_Address'

So this means if I were to take a trip I would have to change the
Path as I drove out of range of a switch.

Not very usefull...

I will add support for the switch to accept UI's via WIDE

APRS Via WIDE,201338

Now if I take a trip, as long as a ROSE switch hears me it will accept
the UI and pass it to my Home QTH's local ROSE Switch (Address 201338)

There was a request to open up the digi function, I can do that. Maybe
as a configuration option.

I will also enhance the UI's so the switch can be configured to append
a WIDE digi to the frames the switch sends.

ex:

W2VY>APRS,908602,W2VY-3*,WIDE <UI>:aprs data

This should help a bit...

Now for the longer term support (APRS and other applications)

Be able to send a frame into the switch that will get delivered to many
user channels using many special addresses. Local, Regional, National
and maybe Global.

The UI's would be routed via backbones used for other packet networks or
applications. Imagine a packet backbone cloud with sets of APRS User
Channels and Sets of DX Cluster Channels and BBS and etc...

A Shared backbone.

Yes it will need a lot of bandwidth... the more people that can help fund
it the better!

YES, in one word, that will do it!

As far as addressing I guess that can be taken at a later date. Reason for that
is so standard APRS addresses can be used all over the world. Not every area
uses or even has experience with ROSE, this will allow us to integrate non ROSE
areas with ROSE areas. Due to the HF gateways we have large groups of people
interacting with each other from all over, hence the need to be flexible with
address formats.

Bob and SIG,
My apologies for what appears to be a very ambiguous message.

First, the signature of "get a 2nd opinion" refers to my second Internet
preoccupation, a mailing list for brain tumor patients, of which I had one.
And the 2nd opinion applies to medical opinions.  Sorry!  It's fixed.

Secondly, I made a typo in the ripple specs...it was 0.3 dB.

And thirdly, I am very pleased with the bandpass filter, ESPECIALLY since I
got it for so little $.

73's
Barry.

The ROSE addresses are just in the digipeater field, it's a local thing...

But it IS based upon an International Standards (as is the rest of ROSE)
The ROSE addressing is X.121 and can address the entire world.

ROSE itself is CCITT X.25 on top of ARRL AX25.

Dear Bob,
On I mailed you an order blank to register my copy of APRS and requesting a disk with a copy of the latest version. With the registration I enclosed a check for $33.00 to cover the cost of registration and the disk. I received a post card with my validation # which worked fine. I did not; however, receive a disk. Do you plan to send that when the next version comes out? If not, I would like the $9.00 back. My address is

Alfred E. Abbott, Jr.
2906 Canyon Creek Dr.
San Angelo, Tx. 76904

Thank you,

Fred Abbott, KN4JS

Subject: [APRSSIG:6119] ROSE and APRS - Current and Future Abilities

Now for the longer term support (APRS and other applications)

Be able to send a frame into the switch that will get delivered to many
user channels using many special addresses. Local, Regional, National
and maybe Global.

The UI's would be routed via backbones used for other packet networks or
applications. Imagine a packet backbone cloud with sets of APRS User
Channels and Sets of DX Cluster Channels and BBS and etc...

A Shared backbone.

Yes it will need a lot of bandwidth... the more people that can help fund
it the better!

I uploaded the LOGSAT51.EXE file to the TAPR upload directory earlier this
evening. It's definitely worth taking a look at it.

Get to it by:

      ftp.tapr.org

directory:

      /tapr/SIG/aprssig/upload

file:
       logsat51.exe

With a 28.8K modem, it took about 6 minutes to upload it this evening. With
the same modem it took over 45 minutes to download it from England last
night, but most of that time was spent waiting for something to happen!

Enjoy!

Message-ID: <2.2.16.19960120084607.0b97f366@mindspring.com>
Rendered body type: text/plain

This is addressed to those in Florida, mostly. Sorry for the bandwidth everybody else.

Here's another moving target for y'all.

I'm leaving Monday the 22nd for an extended business trip to Florida. I'll drive down I-75 and then go to many of or local Offices for several days at a time. All the while, I'll run APRS in full computer mode with GPS and at least VHF. Haven't got HF antennas on new Van yet.

I'll try to GATE occasionally but will mostly be on whatever local VHF nets there are.

If any one has any maps of Florida other than what is already in SEMAPS07.ZIP, please let me know.

My trip will cover the following towns: Brooksville, Tampa, Orlando, Cocoa, St Petersburg, Sarasota, Punta Gorda, Sebring, Ft Myers.

I am planning to attend the Miami and Orlando Hamfests as well.

If any of the local Hams/APRSers/ATVers want to get together for lunch or dinner bunches, please let me know- it gets boring on the road.

Along this same note- My Company doesn't pay for weekends. If anyone near Orlando and Miami wands a nice houseguest for the Friday/Saturday nites of the Hamfest , please let me know. I don't take up much room and dinner would be on me.

Thanks-

                 Ralph Fowler, N4NEQ   S.E.R.A. ATV Technical
Advisor

Rendered body type: text/plain

For those of you who are interested, I'm going to experiment with APRS on RS10 this weekend. Look for me around a downlink freq of 29.370 + or - doppler. I'll be using Grid in TO mode (if I can figure it out!) on passes beginning at 1447 Z on the 20th.

If you want to try also and are not familiar with RS-10 operation, the uplink frequency for this downlink is 145.8715. You CANNOT use FM on the uplink. It must be FSK or AFSK in SSB (just like hf), so you need a multimode to try this. I will be using 300 bps.

I will not be available for keyboard/keyboard during the pass at 1626, but should be here for all others.

See you all on RS-10!

511. APRS/AEA HELP

From: WB4LTF@aol.com
Date: Sat, 20 Jan 1996 09:49:34 -0500
To: aprssig@tapr.org
Message-ID: <960120094816_201900897@emout05.mail.aol.com>
Rendered body type: text/plain

I am using APRS v7.4e (registered) and an AEA PK-232 (OLD Model. firmware dtd. 6/87).
I have two problems.
 1. (This seems to relate to ver 7.4e as it never happened till I installed

this ver.) When I start the program (which I have and re saved a number of times) sometimes (more often than not) the program comes up with my path set to RELAY, even though ,using the tab key tells me it is set to something else. The only way I can get out of RELAY is to do a "U" none and then "O" , "D" and the saved path. Sometimes this doesn't even work and I have to change paths to some other stored path and then back to the one I want. Although this is not catastrophic it is an annoyance, and I end up transmitting a bunch of unwanted signals.

2. (This I believe to be a problem with the AEA TNC) When trying to change into SPACE mode, everything seems to go as advertised UNTIL I transmits the first time, then, I See my own sig.(ie: My: WB4LTF*>W3EAX> ect.ect.) and the alarms go off and Success is set. I have ECHO set to off and use the standard configurations as set in INITAEA.TNC.

Is there a work around for either of these problems, keeping in mind that the PK-232 is the old model (before mailbox)..

Thanks for any suggestions.

Well, Peter, a number of the guys here in the Dallas/Ft. Worth area are using the Garmin GPS 45. I'v had mine since last summer and have been pleased with it. Got it from West Marine for about $300. I've also got the mounting bracket and the Garmin power/data cable (about $35 each additional). However, these save a lot of hassle in getting it mounted and hooked up.

One thing to consider in mounting the unit is how good a look at the sky the antenna will have. After mounting the original GARMIN antenna on a window mounting bracket and connecting to the receiver with about a 6 foot length of cable (Radio Shack mounting bracket) and using that for a while, I decided to get a remote, amplified magmount antenna (Motorola ONCORE). This antenna is now mounted in the center of the dashboard right next to the windshield and has a pretty good look at the sky. The amplifier makes up for the feed cable loss. The window mount worked, but the amplified antenna works much better.

Garmin also has a remote amplified antenna, but I like the form factor of the Motorola a little better. The Motorola is like a hockey puck, the Garmin is about 6-8 inches tall and about an inch in diameter.

FYI - hope this helps.

I have had the same bug in mine as well. I am using an updated pk-232mbx with the APRS 7.4e program. Not only does it default to RELAY but it seems the program sets the tnc to converse mode and then tries to set some parameters which consequently end up going over the air as unproto packets.

WB4APR REPLY COMMENT:

Are you switchihng back and forth between HF and VHF? When ever you do this, APRS always forces RELAY on VHF and NONE on HF. COuld this be it?

526. SPRE QuickTime Movie

From: w5rkn@amsat.org (Ronald G. Parsons)
Date: Sun, 21 Jan 1996 07:52:47 -0600
To: aprssig@tapr.org
Message-ID: <v02130500ad27f1d49dc8@[204.251.33.17]>
Rendered body type: text/plain

I have created a QuickTime movie of a SPRE pass using APRtrak. The file was
re-created using the history file and consists of screen images stitched
together into a real-time re-creation.

The movie lasts about eight minutes. It is viewable on either Windows or
Macintosh with the appropriate free viewer.

Do you need a QuickTime Player ? Try: http://quicktime.apple.com/

Viewers are available for both Windows and Macintosh.

The presentation is a recreation of the Spartan Packet Radio
Experiment(SPRE) pass over Austin, Texas on January 15, 1996 between 12:30
am and 12:40 am CST. These screen images are derived from the APRtrak
History file. This was the only pass of SPRE over Austin after being

deployed by the Shuttle Endeavour (STS-72) and before the package failed
over Australia later in the same orbit. The presentation begins before the
first signal is heard from SPRE. Only the ground station W5RKN in Austin is
displayed on the map. As signals are heard from other ground stations,
their location and call sign are displayed on the map. Their location is
derived from the Grid Square contained in the digipeated packet. The
contents of this packet is shown on the bottom of the screen. The location
of the SPRE package (call sign W3EAX) was recreated from tracking data as
the GPS data from the satellite was incorrect.

The file SPRE-NS.MOV has been uploaded to

ftp://ftp.tapr.org/tapr/SIG/aprssig/upload

Ron W5RKN

Message-ID: <10251eb0@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

1515Z Pass, Sunday Jan 21.

Heard several packets through RS-10, but due to low elevations, was
unable to completely copy anyone.

Next pass is 80+ degrees and should afford much better opportunities
here. Next pass is at 1656Z.

73!

Rendered body type: text/plain

The following list of 60 callsigns is everyone that I have been able to
determine that successfully digipeated a packet via SPRE. If anyone has
any other stations not shown that they *know* were digipeated via W3EAX,
please send me the appropriate packet. Do NOT send me any more log
files, unless you cut out only any missing calls. The only non USA logs
I received were from Japan, Taiwan, South Africa, and Honduras.

NOTICE NOTICE NOTICE

NIAN (Northern Illinois APRS Network) will have Keith and Mark Sproul, Mac/WinAPRS authors, as their special guests for the Jan 27th meeting in Aurora, Illinois.
They will be demonstrating and distributing, to those in attendance , the much awaited public BETA release of WinAPRS. This will be followed up by the general release the following day.
If there are other APRSSIG members who would like to talk with NIAN, Keith or Mark on the 27th here is an idea.
I will run WebPhone with APRS in the Company name search field, setup the hardware for our members to hear (external speakers and remote mike) and field some calls.
If you want to join us please do the following,

Use your call in last name field and APRSSIG as your company...

Try and get a group of users together a one location, we would prefer to speak to groups as opposed to single callers....

Connect at 28800, a 14400 connection on WebPhone is to hard to work.....

Try and call about 1100 CST.....

Remember we can only to talk to one caller at a time so please have your
questions or comments ready, be brief and don't be offended if your get
placed on hold, cut off or it takes us a while to answer your call.....

remember, IT'S A HOBBY, IT'S SUPPOSED TO BE FUN.......

a beta version of Webphone can be downloaded off net, use search word
webphone from your browser.....

I know that there are other phone/voice products out there but Webphone
seems to work the best for us, would be nice to have Conference call ability
for multi connects however....

hope to talk to some of you next weekend...

Rendered body type: text/plain

```
Help!

I am having a problem in not seeing a local digipeater appear on my screen.
I am using a pk-232mbx and APRS ver. 7.4e. The local digipeater is a
Heathkit HK-232 with the following BTEXT and UNPROTO programmed in:
BTEXT !4027.92N/09041.17W_ Macomb Radar
UNPROTO APRS via WIDE
MYCALL WB9TEA-10

The digipeater beacons every half hour. However when it does, it shows
up on my aprs program as this:
No>: WB9TEA-10*>WIDE>APRS:!4027.92N/09041.17W_ Macomb Radar

A couple of the locals that are using an older version of APRS claim they
are seeing the digipeater with no problem as a blue weather dot.
I cannot see it however I can see everyone else with no problem!
```

```
When pressing the TAB key, the following parameters appear on my screen:
VAL|TNC|4800|15|gfl|junk|30/540|dgps|MYA RELAY|   |IL|BEEPS
XMT|log|UP|DR|cw|PFL|other|VHF|FADE|VIA WB9TEA-10, WIDE
```

Can someone tell me if I have something set wrong with the info given or
is there something quirky about the most recent version?

540. Re: [APRSSIG:6155] APRS74E + 16550 UART

From: n2czf@gate.net
Date: Sun, 21 Jan 1996 21:10:29 -0500
To: aprssig@tapr.org
Message-ID: <199601220210.VAA43786@osceola.gate.net>
Rendered body type: text/plain

THis brings up a good question, I do not believe I have a 16550 UART on my card but I do seem to have a occasional problem with my serial card. I will get the PC to send to the TNC a command at times and all of the sudden the program will lock up. Usually happens when I am not looking at the screen or at work and when I do return I see "Sending to TNC" in the upper right. All I can do is abort the program and restart it losing any information that was on the screen.

This has been going on for a few years now with a previous PC (286) and both under WINDOWS and DOS. I am now on a 486/66 and nothing has changed. I allways thought that I NEEDED a 16550 to resolve the problem, now I see a 16550 can also cause it! What is one to do ??

Hi Bob (Bruninga):

I thought you knew...this does appear to be a bug with v7.4e. Two friends
agreed they have the same problem, namely, that you have to manually
reset the Unproto path using OU. None of us had been jumping back and
forth between HF and VHF although I confess I recently tried HF for the
first time... of course it had the problem before that.

Well Gene the problem you speak of below must not be an APRS7.4e
problem since i have been runing it without any problem on my P5-90 ever
since it came out. I also have the fast as you call them uart chips. Just
to let everyone know. I think it's in the TNC!.

W1KRU's maps are available at the tapr ftp site (ftp tapr.org). The
latest version has just been uploaded as mamaps03.zip (I think that's the
correct name)

Hi, Richard: Well, I got the Motorola antenna as a somewhat special case.
Ralph Fowler, N4NEQ, rwf@mindspring.com, a frequent contributor to the
APRSSIG, happened to mention last summer that he had negotiated a group
purchase plan for a number of the antennas (maybe some other things too,
don't know) and had an extra one. I asked if I could buy it from him - the
answer was yes, and that's how I got it. Cost ~ $100. I really don't know if
he has any others or not, or even if Motorola is still making them. Even if
Ralph does not have any more now, though, he ought to be able to point you
to the Motorola contact point. 'Fraid that's the best I can do for you now.
Let me know how it works out. I hope you can find one of those antennas -
they work like gangbusters!

WB4APR REPLY COMMENT:

In the version BETA2000.zip which attempted to fix the U-2000 interface, I
also took a crack at fixing the INIT process to PREVENT some of the TNC
commands from being sent over the air.  That fix may also fix this AEA
problem.   WOuld those of you having this problem download the BETA2000.zip
and see if it helps?  The EXE will identify itself as 74f, but other than
this test, do *not* encourage people to get 74f since it is just a test.

> The digipeater beacons every half hour. However when it does, it shows
> No>: WB9TEA-10*>WIDE>APRS:!4027.92N/09041.17W_ Macomb Radar

WB4APR REPLY COMMENT:

Good detective work, and Darn those AEA TNC's! hi hi
I bet the WB9TEA-10*> is being rejected by APRS because that Darn *
before the > makes it look like a 10 character Callsign which is
impossible.  SO APRS says that the > symbol is too far into the packet.

1) You WILL see it, however, after it is digipeated

2) Shortening the call to -9 or less will also fix it.

3) Ill try to reemember to fix it in the next version of APRS, (if I have
room)...
```

Pse confirm that this is the problem. Have a CLOSE friend temprarily set
his ALIAS to WIDE so that you hear the packet DIGIPEated. If you then
seee it, then that is the problem, and let me know....

I have heard that all the 16550s in the world will do you no good unless the programmer enables the fifo buffer. I have no idea what the steps are to do this- but this may need to be looked at in the APRS code.

Bob, I have a PK-232MBX and it has consistently done the same thing.
In addition, if I Alt-S, T, it returns it from RELAY to WIDE,WIDE.

I've also found it to XMIT my AEAINIT.TNC (or wherever the commands come from upon start-up) file when first starting the program...via RELAY, of course. Alt-S, T will return it to proper operation.

Rendered body type: text/plain

```
I have had need of the C, B and V or H functions to channel data to either
the vhf port or the hf port of my KAM. I am using 74e. My KAM 4.0 switches from
the hf to the vhf port ok. It will not switch from the vhf to hf port. Is the
SYSTEM initialzation file used in the bandswitching operation? Just the stream
switch? Maybe a basic configuration command error? My KAM 7.0 had the same
problem.

   I also perceive a malfunctioning? A list/log. It just saves my rxd and
txd message lines. I have tried most/all? variations of filter commands
in hope of saving ALL rxd packets, without success. An A list/log like it works
in APRTRAK would be handy for terrestrial use, as well as space operations. I
seem to remember that back in the dawn of time, when APRS was in relative
infancy, the A list/log did save ALL packets heard.

   Any help, (no WAGs), would be appreciated.

                                        TIA,
                                             Pete

Rendered body type: text/plain

```
Peter,

I use an Eagle AccuNav Sport and love it.  Though many use and love the Garmin
45's I chose the Eagle for three reasons.....

1)      The Eagle employs true multi-channel reception (five actual channels for
reception), tracking five satellites simultaneously.  The Garmin has only one
channel and so must sample each satellite in turn (Don't be fooled by the
"multitrak" language in their literature).  The practical implications for
mobile operation are:
        a)      more stable tracking when going under trees and other "minor"
obstructions.
        b)      quicker reaquisition of "lock" after having been totally blocked
from the satellites and losing lock.

2)      The Eagle does not need the expensive amplified antennas in order to work
well in a vehicle.  LEI Inc. (Loran/Eagle) makes an
extension-cord/suction-cup-mounting-kit accessory for about $25.00 which allows
you to mount your antenna in the windshield.  This works extremely well.  The
only trouble I have ever had with that was encountered when going up steep
mountain roads which hug the mountain and go around it........thus hiding 1/2 of
the sky at a time and then showing you the other half.......effectually
completely changing your visible satellites!  In those situations the Eagle
reaquires lock within 5 seconds at the most.
```

3) The Eagle employs a much more rebust design in their antenna attachment than the Garmin. Garmin's design is more convenient (ony a bnc conn. holds it on) but the Eagle, with its double-screw attachment, won't create intermittant signals (a common complaint with the Garmin 45).

Both the Garmin and the Eagle are compatible with APRS. What you need to look for on that level is "NMEA 0183" compatibility. Any unit using that data standard is compatible.

Price is comparable but the Eagle is more expensive for the unit itself ($384.00 at BassPro Shops when I purchased mine). NOTE, however, that by the time you buy an expensive amplified antenna($100.00 if you're lucky) that you will end up with more money in the Garmin than you would have spent on the Eagle with its extension kit!

Good Luck!
Hope to "see" you soon!

558. RS-10 Experiments

From: dwetzel@uswest.com
Date: Mon, 22 Jan 1996 12:31:18 -0600
To: aprssig@tapr.org
Message-ID: <103dbb90@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

Due to an intense interest on the part of my xyl to have me do things other than
watch orbit passes, my RS-10 experience was less than optimal.

I did hear packets on every pass from somebody, and my own in most cases.
Signal levels were very low, and it was difficult to tune (between the doppler
shift and qrm from my wife!).

I do have a couple of observations:

1. Signals are not usable at elevations below 10 degrees at my qth (mountains
in the way).

2. The grid-square format probably won't work well for RS-10. It appears that
the packets are just too short in that format for reliable tuning.

3. The APRS AMTOR mode might be more suited for these experiments.

4. I need to send my xyl on an extended trip.

5. Uplinking with an omni antenna is going to require more than 10 watts.

6. RS-11 might be a better vehicle to try this, as we can uplink on 15 meters,
with much less doppler to worry about.

After a couple of weeks of regroup time and independent experimentation, I would
like to try this again if anyone is willing to do so.

Thanks to those who did get packets through the bird.

73,

Doug

Rendered body type: text/plain

There is NO GPS receiver made that will work as well inside a vehicle as it
does with an external antenna, and to state that it does not need one is totally wrong!.
If you just purchased this GPS receiver then how do you know. It doesn't
make sence since it cannot see all the satellites from inside a vehicle. I have
a Magellan NAV5000DX and believe me it works much better with an external
antenna, altough it will work inside the vehicle also. I see one of local users
all the time that has his mounted inside the vehicle and leaves it running all
day long. When zooming in on his position at his work QTH you will see a
huge circle of position reports because of that same reason that he doesn't
have an external antenna.

560. SPRE movie with sound

From: w5rkn@amsat.org (Ronald G. Parsons)
Date: Mon, 22 Jan 1996 14:49:48 -0600
To: aprssig@tapr.org
Message-ID: <v02130500ad29a6ff9410@[204.181.160.12]>
Rendered body type: text/plain

I have created a QuickTime movie of a SPRE pass using APRtrak. The file was
re-created using the history file and consists of screen images stitched
together into a real-time re-creation. I have added a sound track in this

version. There is a voice-over at the beginning and end, packet "burps", and a couple zoom frames at the end.

In order to make the file size more reasonable, the sound was down-sampled to 11k samples/sec and 8 bit data. The .ZIP file is about 1Mb and it expands to about 5.5 Mb.

The movie lasts about eight minutes. It is viewable on either Windows or Macintosh with the appropriate free viewer.

Note to Mac users: since the Mac specific attributes were removed from the file to provide cross-platform capability, the movie file is not double-clickable. Launch MoviePlayer and use the File/Open menu to open it.

Do you need a QuickTime Player ? Try: http://quicktime.apple.com/

Viewers are available for both Windows and Macintosh.

The presentation is a recreation of the Spartan Packet Radio Experiment(SPRE) pass over Austin, Texas on January 15, 1996 between 12:30 am and 12:40 am CST. These screen images are derived from the APRtrak History file. This was the only pass of SPRE over Austin after being deployed by the Shuttle Endeavour (STS-72) and before the package failed over Australia later in the same orbit. The presentation begins before the first signal is heard from SPRE. Only the ground station W5RKN in Austin is displayed on the map. As signals are heard from other ground stations, their location and call sign are displayed on the map. Their location is derived from the Grid Square contained in the digipeated packet. The contents of this packet is shown on the bottom of the screen. The location of the SPRE package (call sign W3EAX) was recreated from tracking data as the GPS data from the satellite was incorrect.

The file SPRE-S.MOV has been uploaded to

ftp://ftp.tapr.org/tapr/SIG/aprssig/upload/SPRE-S.ZIP

WB4APR REPLY COMMENT:

The A list *only* saves BEACONS that are *different* than the previous beacon from the same station. In otherwords, only "new" beacons. Could this be what you are experiencing? Or are you not even capturing "new" beacons...?

>
>Bill KE4EER
i can say that when doug leaves his tracker on at his house his
"circle" ofpositions is just as big as mine.
i am using a motorla encore w/ external ant
i have used both the Eagle and a garmin and they are both good units
i am still biased that my mot works beter than eather of them for
aprs but bill his set up does work well not to say that an external moun
would not improve his reception but if it has a good "lock" inside
the car "if it's not broke dont fix it"

one side not about the Eagle for all to know it does do some thing
funny when it loses lock it presents its lat long as XXX.XXX XXX.XXX
aprs places this in the p list. as an aside when doug does lose lock
```

```
we know it and it dose not give false post data.

I have also had good results, using a Garmin 45 sitting on the dash with the
stock antenna attached to the unit.  The external Garmin mag-mount does work
better but I've found the dash location to work quite well.  I may see up to
200' more estimated error with the weaker signal though but for mobile
operation it's still adequate.  I've never seen it lose it's lock.

>beacons...?

  APRS has been up for 8 hours on hf today. I have 3 1/2 pages of P, L,and D
entries but 0, Zero, ZIP, Nada, etc. entries in my A list. The filters gfl,
junk,
and other show in lower case letters, and PFL in upper case, in my status lines.
```

  The file help.txt, date 12/05/95, indicates in the description of the
DISPLAY screens,
that the A - ALL screen shows all packets received. If that is not so, maybe
a minor
text change would help keep out of trouble, those that RTFM.   :-)

I hope this info helps.

Rendered body type: text/plain

Hello from Cleveland, the home of the Baltimore Browns !!!!!   Please, no
hate mail.... :)   I have been able to locate a very reasonable source of
External GPS antennae, in several amplified and unamplified versions.
        The vendor is MA-Com a (divison /parent co. ?) of Advanced
Receiver Research. or ARR (as in preamps) for short. Delivery was slightly
long lead but the products are execellent. I do not know if they are
consumer direct but I will check. If not I may be able to arrange distribution
as my Co. is able to purchase. Several models incl. preamped for
$100-$150.00 US. Puck style, as well as several coax /mount /shape
arrangements.
    All were surface mount that I received literature on. I have one
currently siliconed to the fiberglass roof of my Bronco and it works better
than the
Garmin provided helix ant. on my Garmin 45 and 65. 4 in. in dia. and under 1
in. thick. with tnc mounted out of bottom. Several also operated in
military as well as commercial band.. I will post addt'l info in the future,
after I look up data at office on tues.
                                                                73.   Doug

I use a Garmin on the boat and the car. I mount the antenna on the roof of
the car and pilot
house of the boat, with a suction cup mount found at Radio Shack. It is has
a 6 foot cable with
the appropriate BNC connectors on each end. It makes a great window mount
for ht rubberducks
and works well for the gps.

I recently got an antenna from LRF Designs that is riding around on the dash
next to the
windshield. It seems to work as well as the roof mount, however, it can't
see 360 deg., more like
180 deg.. Will be trying it on the boat in a few weeks when it is ready to
back into the water.
This is a commercial version of the one on page 44 in the October issue of QST.

As you can see below i did not state that it wouldn't work!!!. I said AS WELL.
Try driving trough downtown Atlanta with the internall antenna to plot points
for a map. Then go back and do it with a good external antenna and see what
you get. All i'm saying is that to flatly make a remark that the Eagle Accunav
does not require an external antenna is not right since this information may be
used by a new user to aprs in buying a GPS receiver, then finding out it's not
as good as with an external antenna. Sure they work that way i knpw there
are many people that use them that way. Just like many people use 1W HT's
to try to hit a repeater from within their car and sound scratchy and wonder
why they don't sound so great. So read the message again IT WON'T WORK
AS WELL...Hi Hi....

Rendered body type: text/plain

```
I have just a quick question for Bill.......have you ever watched your own track
as your vehicle was stationary?  If I'm not badly mistaken (which is entirely
possible!!) the "circles" you cite as an argument for outside antennas has
nothing to do with the unit's accuracy and everything to do with the
intentionally induced errors in the signals coming from the satellites.  Unless
I miss my guess, your vehicle will also track circles as it sits there.  (If it
doesn't, save a track history and send it to me as it would be the first
stand-alone consumer-grade unit I will have ever seen which doesn't do that
without at least some differential correction!)  In other words, the "great
circle" is not a valid argument against an inside antenna, Bill.

That said...Bill is of course correct that an outside antenna is better than one
could ever be that is partially shielded from the sky as is one in any window in
a vehicle.

That said as well.....my argument for the Eagle stands.  For the money, and
given the success I have personally had with the unit (after using Garmins and
Motorolas), I still unequivocally recommend the Eagle Accunav Sport as a great
general purpose unit.  Given the advantages in its receiver it gets my vote.

Bill, I hope you don't think I am trying to flame you.  I'm not.  (No "all caps"
anywhere)  I am just trying to respond intelligently to the points you raised in
your response to my original posting.

Ya'll take care and have fun with whatever GPS unit you have!

To enable the FIFO buffer under Windows 3.1 edit the Windows\SYSTEM.INI
file and add the following line:

[386Enh]
COMnFIFO=1

where n is the number of the COM port.

if your 16550 is installed on COM 1 then

[386Enh]
COM1FIFO=1

Using Windows 95?

Click MY COMPUTER
click CONTROL PANEL
click SYSTEM
click DEVICE MANAGER
click on the desired COM port
click PORT SETTING
click ADVANCED
click the box marked USE FIFO BUFFER
click OK

  Thanks for your comments concerning your experience with the Eagle Accunav. I
have yet to purchase a gps and your information has prompted me to include
that unit along with the Garmin 45 as a likely candidate for my unit. What
hardware
or software problems have you experienced integrating that unit with a
tnc/laptop?

  I failed to find your claim that your unit worked better inside your
vehicle than
it did with an external antenna. I apologize for my poor comprehension skills.
I am sure that others, elsewhere in the country, know what works well for
you and
will be sure to consider the big city environment you failed to mention. I
notice
you  also failed to let others know if it worked well in a submarine. Please
include
a more comprehensive analysis of your unit's performance, next time.  :-)

The Garmin antenna that you describe I believe is the one made for the
GPS40. That one, I've been told, is an "active" antenna, and as such, the
length of the cable can be extended a great deal, even more so than the
antenna for the GPS45 can be, because (I've been told) the GPS45's antenna
is not "active." I do know though that common, and cheap, TV cable (59U)
can be utilised to extend the GPS45's antenna with very little signal loss.

I am for multi-channel parallel tracking GPSs too,( Like my Motorolas), but
I always heard the Garmin was 2 channel.  One channel is processing data
while the second is locking on to the next bird.

The practical implications for
>mobile operation are:

The reason for the external antenna is to give it unobstructed view. The amp
compensates for the cable loss... Something your extension cord will not
do. 1.6 GHz signals are *very* weak. Come do 1.2 GHz ATV with us sometime.

>
>3)   The Eagle employs a much more rebust design in their antenna attachment

Haven't seen the eagle attachment, I hope it has a bnc on it somewhere,
though. And this is strange- I have never heard a complaint about
intermittent connection on Garmin (or Magellan) antennas.

>
>Both the Garmin and the Eagle are compatible with APRS. What you need to look
>for on that level is "NMEA 0183" compatibility. Any unit using that data
>standard is compatible.

The Garmin *is* rather chatty on the serial I/O. 90% of the sentences are
useless to us. I like the Motorola, since we can program which sentences
come out.

>
>Price is comparable but the Eagle is more expensive for the unit itself

Considering all of the recent traffic about mounting your GPS antenna
inside the vehicle:

I received a very nice commercial version of the passive GPS antenna
shown in the November QST.  This Antenna is manufactured by LRF designs
(one of the HAMS here on this SIG).  It is about a 5 inch square of
black aluminum with the approximate 3 inch square patch antenna mounted
1/4 inch above it.  It even has rubber feet on the bottom.

The construction appears professional and it seems to work well,
especially where a low profile antenna is needed.  It is very useful on
the dash board, since it can be placed well forward under the glass,
while permitting the GPS unit itself to be conveniently located closer
to the driver.  It is available from:

LRF designs
3575 Highway 68
Ottawa, KS 66067

I also make the same patch antenna with 10ft of feedline and magnets for
roof mounting. We've improved the low level satellite view also.

I've had great success with it on the roof.

cheers...mike

I've been using the passive M/A-Com antenna on my cows and they work real
well.  The preamp'd versions should also work well, based on conversations
I've had with M/A-Com.  Their specs are reasonable, and based ontheir
real-world reputation, I have no doubt they perform.  If the prices you can
get are acceptable, and they really should be <$100 for those antennas if I
remember correctly, they are great!

I must agree with everything Doug says, I was lucky enough to receive
an Eagle Accusport as a Christmas present this past season. All I can
say is it seems to be far superior to the Garmin's and Magellan's. I
love it and have had no problems at all. 73

I do think everyone who is negatively answering Doug's post has miss
read what he said. He did not say it does not need an external
antenna but infact his statement was it does not need the expensive
amplified antenna. Big difference, we must read the post correctly
to make accurate statements. 73 and all enjoy whatever GPS unit
we have. I am sure we are all interested in hearing about different
units and how they perform.

588. GPS Units (Inside vs. outside ant.)

From: Doug Woodruff <102256.1216@compuserve.com>
Date: 23 Jan 96 13:52:57 EST
To: TAPR E-mail Forum <aprssig@tapr.org>
Message-ID: <960123185257_102256.1216_BHB106-1@CompuServe.COM>
Rendered body type: text/plain

Let me summarize my points for the record ....

"The following represent the personal opinions of the writer and are given
without any express or implied warranty....other than that the writer reserves
the right of defending those opinions." Hi Hi

Now.....

1.) If you drive anywhere with any unit and then drive the exact same path at the exact same speed and try to reproduce the same track (exactly) you will fail every time. The DOD is very proud of their ability to create errors for us (great circles...). When you can travel at up to 2.5 mph when merely sitting still (and this was on the top of a mountain with the unit lying on top of a vehicle ---- qualifying as unobstructed, I believe) then you can do the very same thing in a relative sense even when you are actually moving. Depending on which way the vectors would add up (your actual direction & speed creating one vector and the induced error's direction and and speed creating the other) you might be drifting laterally or merely having your displayed speed made less accurate or some combination of the two.

Thus, if you are within a couple of hundred yards of accurate when moving then that's great. If accuracy is that important in a mobile tracker then you would need to transmit MUCH more often than we can in most areas. Just think of how many thousands of yards you can travel in the five minute interval (or even a one minute interval)----thus making your last transmitted position on the map inaccurate.

2.) My personal opinion of Garmins is not good. Other people may have good luck with them but my personal experiences were not good. That is the reason I went to the Eagle. The specific problem I had was a loosening of the BNC connector on the unit itself. After finding a forum on the Internet which was for Garmin users I found out this is a common problem with the Garmin 45.

The Eagle employs a double screw-in hinge arrangement--not as convenient but very durable.

3.) The Eagle has a better receiver than the Garmin 45. (Garmin does make true parallel multi-channel receivers but the ones I found were out of my price range---don't you hate it when money get's in the way of Ham Radio!!)

4.) When I have Dilution of Precision numbers in the 1.25 to 1.5 range even when I am moving with an inside antenna then I can unequivocally state that the unit works like that. I never said that it worked better than an outside antenna......only that it works great......I still stand by that opinion.

5.) For the $400.00+ dollars you will have tied up in a Garmin by the time you get an amplified antenna you could have an Eagle with its better receiver and get the extension kit and have a working unit without the need for another hole in your vehicle or another coax run under the seats.......(I don't have any idea how Garmins work with passive antennas like the one from LRF Designs------I do know that Garmins have voltage on the connector....probably put there for a reason.).

One other thing I failed to mention is that the Eagle has a very large LCD display.....much larger than the Garmin. Handy when you're mobiling along and want a quick look at your position (I did this quite frequently this weekend as a rover in the VHF contest......had to make sure where the grid-square lines are!)

That all said, maybe what the SIG needs is a side-by-side comparison of several units which various members own. I'm sure that with some logistical planning that several of us could get together and put all our units to the test under very similar conditions. There would need to be some fairly careful analysis of the outcomes since even two identical units can give different readings sitting together at the same time (they might be seeing different sats.)

Good APRSing all,

Doug, KM4HY
Athens, GA

Rendered body type: text/plain

I would like to thank EVERYONE who responded to my call for help and this seems like the best way.

THANKS EVERYONE!!!

It seems I'm not the only with the default to relay and have also heard fro others that it is not only an AEA problem.

I will download the BETA2000 ant try it as I see others who say it fixes the problem.

```
As for my problem with SPACE and the  Echo of my outgoing sig;
  The OLD AEA's did not have a MXMIT command so that will not help.
I'm still looking.

Lastly;

A HEARTY WELL DONE to Bob (APR) for a GREAT program and an equally fine job
of responding (very diplomatically) to most Questions...

Bud

> do better (ie more points) etc...
>

MacAPRS and WinAPRS use the EXACT same format for the map files.

This format is a BINARY format, and although not proprietary or secret,
is not something that you can make maps for by hand..

MacAPRS and WinAPRS will read the PC/DOS APRS map files DIRECTLY,
NO CONVERSION NEEDED!

As far as point limitation. We  LITERALLY made a map that was 12 MILLION points
and tried it just simply to test the program, and it worked JUST FINE. (It
was a little slower than most people would want to put up with, :-> )

Typically, I use maps that are in the 15,000 to 50,000 points on a REGULAR
basis. (the SMALLEST map I normally use is over 10,000 points)

Also, we have added some new stuff to the map drawing capabilities of MacAPRS
and these features are, of course, spilling over into WinAPRS..

We will have a CD full of maps available at DAYTON this year. This CD will
be CLEAR FULL of maps.. (This was announced awhile back).. We will not
only have ALL of the PC maps we can get our hands on, but it will be
clear full of all of the high-res maps that the Macintosh people have
been used to for the last year or so..

Also, As I announced here recently, I am now using a data base that contains
Map data for the ENTIRE world at a 1:1,000,000 scale.  Unfortunately, I have
found out that this CD set is currently not available, and that an UPDATE to
it SHOULD be available by the end of the year.  In the mean time, I will
be distributing maps from it..
```

```
If you want to look at some of the new maps take a look at:

        http://www-ns.rutgers.edu/~ksproul/APRS/Maps.html

>>> Gerald J Creager <gerry@cs.tamu.edu> 01/23/96 09:12am >>>
>>> I've been using the passive M/A-Com antenna on my cows and they work real well.

I'm glad someone else is using APRS to track livestock.  I have been using it for some time
on my chickens, and have these observations to share:

1. Mag mount and suction cup mounted antennas seem to have adhesion problems.  Three
    inch lag screws seem to work better, but can get a bit messy.

2. Sears Die-Hard 60 amp batteries give lasting performance, but I don't yet have any long
    distance data.  The chickens so equipped seem to stay near home much more than the
    chickens with the lighter weight batteries.

3. Ducks equipped with APRS equipment tend to spend much more time at the bottom of the
    pond.

Rendered body type: text/plain

```
Hi, and gotta problem.  Hope you can help.
A fellow in Rockford, IL had some friends buy some brand new KPC-3's for use
with APRS (ver 7.2d+).  The problem they all had was, while the program
worked fine on a KAM, it wouldn't work on the KPC-3.
```

```
The program came up, drew maps of the area, and logged stations in the
H-list, and the A-list, but didn't record on the P-list, or plot on the maps.

The TNC's worked ok on terminal programs, and the MON was set to on.

I was under the impression that the KPC-3 worked fine out of the box.

Can anybody think of a reason they won't show on P-list or maps?

Thanks and 73

```
Just got the fax from Carl Weisman of M/A-COM re the two amplified
     M/A-COM antennas designed for external mount on a vehicle.

     ANP-C-110:  white hockey puck 3.0 " dia, 0.66" high, <100 grams, TNCf
     or SMAf or pigtail, mounting can be magnetic or bolt-down, intenal LNA
     has 16dB gain, requires 5V at 25mA on the antenna coax for operation.
     Price: $69 in 1-49 quantity

     ANP-C-114:  white hockey puck 3.0 " dia, 0.66" high, <100 grams, TNCf
     or SMAf or pigtail, mounting can be magnetic or bolt-down, intenal LNA
     has 26dB gain, requires 5V at 35mA on the antenna coax for operation.
     Price: $79 in 1-49 quantity

     Both antennas have a o-ring grommet on the back side for sealing.

     Carl indicated on the FAX that there may be a minimum buy required to
     get these prices, which seems a bit peculiar.

>       so that I may obtain it?

WB4APR REPLY COMMENT:

Any digitizer which outputs XXXXX,YYYYY,z each time your press the mouse
or PEN will work with MAPFIX.  Get it to work with PROCOMM first.

It doesnt matter whether a map is compressed or uncompressed.  Once it is
loaded into MAPFIX it is in the same internal format.  The difference is
when you SAVE it.  If you save it in compressed format, it does NOT save
the name you assigned to the particular feature.  This name is NOT used
by APRS, but is sometimes useful when using a TEXT eDITOR to look through
the file.  Since hardly any maps are made by hand anymore, these labels
have little or no value.

Before you save a map in COMPRESSED format, be SURE that all points are
within the YELLOW BOX  which means they have a value between 0 and 1024
in the Y axis and 0 and 2048 in the X axis.
```

605. Garmin 45 Rationale for selection

From: "Jon T Adams" <Jon.T.Adams@jpl.nasa.gov>
Date: 23 Jan 1996 14:51:04 -0800
To: "aprssig@tapr.org" <aprssig@tapr.org> (Return requested)
Message-ID: <05F3E3105665800C*/c=us/admd=telemail/prmd=nasa/o=jpl/ou=ccmail/s=Adams/g=Jon/i=T/@MHS>
Rendered body type: text/plain

```
I own a Garmin 45.  It fulfills nearly all of my needs for a very
     reasonable price.  I looked at about 25 different ones, from handhelds
     (Trimble, Magellan, Motorola, Garmin, Sony, Icom, Panasonic, Eagle,
     etc...) to fixed mounted ones (Garmin, Lowrance, Apelco, Eagle,
     Micrologic, Raytheon, Magellan).  My rationale for selection was based
     upon the following:

     Cost:      1) As little as practical, preferably $500 or less.  Only
                   wanna buy one.

     Uses:      1) Handheld for backpacking, hiking, biking.
                2) Able to be used in vehicle and ported to vehicle
                   computer or TNC.

     Graphics:  Ability to plot course on display to aid in dead-reckoning.

     Display:   1) Backlit (full-time if desired).
                2) Characters large enough to be read in mobile
                   environment.

     Size:      1) Small enough that I won't make an excuse to not carry
     it.

     Weight:    Small enough that I won't make an excuse to not carry it.

     Water
     Resistance:1) Needs to be immune to minor incursions con agua:
                   dunking, rain, soda, beer, etc...

     Power:     1) Gotta run for many hours (10-20) on little batteries or
                   on external power.

     Other
     Features:  1) Any cool gadgets that improve the odds that I'll carry
                   it around with me.
                2) Ability to remote the antenna.  Didn't want to get stuck
                   with one of these that have a built-in antenna.
                3) Decent mounting bracket for the truck.
                4) Not too big so that I can mount it in the truck.
                5) Quick portability from truck to pedestrian mode.
                6) Simple data/power connection using standard connector.
                7) NMEA 0183 support.
                8) Uploadability / Downloadability of waypoints, etc...
                   from my computer.

     There may be some other things, but these were the main desirements.
     The Garmin fit most of these.  What do I not like about it?

     1) It does not have a display suitable for reading at 75 mph on I40 at
     midnight, especially when tired.

     2) Weird, proprietary connector for power/data.
```

3) The mag-mount external, amplified antenna, while improving the performance of the machine immensely, can get knocked off by large shrubbery or car washes. This dings up the truck. (Of course, so do the large shrubberys.)

4) Switcher noise and computer noise generated internally cause interference to my truck AM BCB radio, noticeable even with a local strong station like KNX.

5) Receiver (or LNA in antenna) can get swamped by HF transmitter, VHF transmitter, UHF and SHF transmitters. Can't transmit too long (20-30 sec continuous) on 2m (45W) or 7 or 14 MHz (100W max) without losing satellites. GPS antenna is hood of truck (Suburban), right side, forward of windshield abt 8", all VHF/UHF/SHF antennas on roof, HF antenna at rear left bumper of truck.

6) Not really a problem for me, but a gripe: won't work at speeds in excess of 99.9 knots (115.3 mph). Apparently the software is designed to stop working at that speed. (The rumor has it that it is so aviator-type folks wouldn't use these in lieu of Garmin's more expensive units). Have only achieved speed of 108 mph (not recommended) so this is only a nit.

What do I like about it?

1) Small! Tiny! Light-weight!

2) Nice back-lit display!

3) Many cool functions!
   Sunrise/sunset calculator
   Great circle distance calculator
   Map plotter
   Satellite position and signal strength display
   Nice battery indicator

4) No need to send a command string on RS232 to get it to start outputing data sentences.

5) Runs on +7 to +30 Vdc...

6) Works really well in canyons (I'm talking Grand Canyon, at the river), under heavy foliage. Obviously the former is dependent upon satellite position, but the latter is a real problem due to absorption.

7) Heavily supported by a large group of owners. Has a discussion group on internet. Much software written specifically for Garmin available on Internet, especially from Peter Bennett's site.

8) Weird proprietary connector now being manufactured and distributed for free by a guy on the net. This is part of the reason why 7) is important.

9) 250 waypoints, of which I've used only 82 in eight months of ownership.

10) Simple, quickly-learned controls that can be found by feel.

11) Decent little bracket that holds it captive on my center console. Fairly easy to remove and install unit into bracket.

12) Rubberized in various places to improve grippability.

13) Supplied antenna is easily attached and detached from unit, but not too easy. Have never seen any instance of poor performance due to intermittent antenna connection. Antenna folds down along side the body of the receiver when not in use.

Notice that nowhere in here do I say anything about multichannel receivers, fast lockup, etc. The first used to be important to me. This is also my second GPS unit, a 4-channel parallel Sony being my first. After using the GPS45, for a few weeks under a tremendous variety of conditions, I can say that for my purposes the multichannel receiver is not high on the list of requirements. If I was in an aircraft or racecar it might again become important. If I needed to worry about internal clock jitter affecting the position estimate (and SA were off) it might become important.

Speed of lockup varies tremendously. I generally leave it on 24 hours per day, 7 days a week in the truck. In tough situations, under heavy foliage in a deep canyon in a torrential thunderstorm and driving through a tunnel it still seems to lock up fairly quickly (good enough) once it sees the sky. When I take it across the country or to another continent, I use the Skysearch mode and that can take up to 30 min or so to lock up. I could improve that by inputting the estimated position but I'm lazy. Normal lockup is about 40 sec from power on if the satellites are visible and the position hasn't changed by more than a couple hundred miles or so.

After the eight months of service from this unit, I can say that I'd buy it again. For any GPS receiver used in the mobile, use an external antenna. You wouldn't outfit your 2m mobile with an internal antenna if you wanted good performance, so don't handicap your GPS unit. You need full sky coverage.
You gotta choose what fits your requirements best.

73 - Jon NW6H

>love it and have had no problems at all. 73
>
>Brad

Thanks for your input Brad. I appreciate your personal opinion concerning your impression of the Eagle AccuNav unit. With luck, all readers will not perceive lab specifications in your comments. With a little more input, I may find the courage to purchase something other than a Garmin 45 with an outside antenna. Keep the technical stuff/opinions coming.

Feel intimidated, yet?

609. 1) GPS Receiver selection.. 2) APRS Satellite?

From: "James R. Duncan" <102413.375@compuserve.com>
Date: 24 Jan 96 00:46:50 EST
To: "(unknown)" <APRSSIG@tapr.org>
Message-ID: <960124054649_102413.375_BHA96-1@CompuServe.COM>
Rendered body type: text/plain

```
First, here's something to get KE4EER going:

I'M BUYING AN EAGLE GPS!!!!!  (note shouting i.e. highest mountain top
therefrom)

After reading all of the info on the SIG and from what other have told me from
experience, I believe that's the way to go!  So, read it and weep!  Now all I've
got
to do is come up with the $$$!!!

Second, with regard to the LRF Designs GPS external antenna:  I don't know very
much about the antenna itself, but I can vouch for Paul!  Paul came out of an
early
retirement to work for Garmin here in Kansas City for the past two years.  I
believe
that he's now officially retired but is doing some contract work for them, at
least if
his stand-alone tracker is any indication (he still plots the same path every
single
day and we all wish he had a laptop in the car!).  Paul undoubtedly has the
background
from the Garmin experience and, if memory serves, from many years with King
Electronics (aircraft radios etc.) to produce a quality, well-tested and useful
product.  Anyone wishing to contact Paul can leave mail to him via me.  I'll
pass it
along via local packet!

Now, on to other things....

Here's a thought sure to kindle the fires down South....

Bob mentioned some two weeks ago of having been approached by NASA or somesuch
to develop a hand-launchable satellite which would fly in a shuttle mission in
March '96.
He's already told me that the launch window has fallen through, but is working
on a package
using the MIM module.

Now here's my idea:

If we're going to fly an APRS Satellite, we'd better look at channel utilization
(oh, GAWD, not again!).
Obviously the package couldn't serve as a simple space digipeater on 145.79.  It
would simply be
overloaded!  My suggestion is to develop a package that would transmit on
445.925 MHz (the APRS
UHF frequency) and serve as a store-and-forward system.
```

```
One station in each APRS LAN would be the designated space gateway for his/her
area.  The
satellite would be programmed to send a standard APRS query to one station at a
time and then
wait for a data dump from the uplink station which would include the latest
position of all stations
in that particular LAN.  The satellite would then retransmit the data on its
downlink and proceed to
query the next station in its pre-programmed list.  Of course the space-gate
should only uplink
the locations of stations within its own LAN, not those received from HF gates!

Of course, this would mean a considerable amount of pre-launch planning and
cooperation to set
up the space-gates and it would also mean that the satellite would HAVE to have
the ability to have
its data tables updated by one of the ground controllers to update the database
as space-gates open,
close or change.

Could one-liner messages be included?  Possibly, but if the primary purpose is
tracking
and data relay, my suggestion would be to limit the bird to that type of traffic
only.

OK, fellers, chew on this one and let's see just what ol' Jim can stir up!

73's all!
de Jim, KU0G
APRS--Kansas City
```

610. APRS Tropical Storm plotting

From: KSwaggart@aol.com
Date: Wed, 24 Jan 1996 01:33:40 -0500
To: aprssig@tapr.org
Message-ID: <960123225028_125355618@mail06.mail.aol.com>
Rendered body type: text/plain

```
Hi APRSers,

  Last summer I was trying to get some software working which would extract
data from the National Hurricane Center's marine tropical storm warnings.
About the time I got it to work, the neat feature of max wind radius was
added to the APRS tropical storm plot capability and I never got around to
adding this data to my extraction code.

 I would like to get this software tool working this winter, and need some
examples of tropical storm warnings from last years hurricane season. If you
still have some squirrled away on your hard drive, please zip up a few and
send them to me (not the SIG!) as an attached file. I need examples of
hurricanes, tropical storms, and tropical depressions, in the message format
the NHS uses for maritime interests which has a very predictable stucture.

 When completed, this software tool should read the NHS messages, which you
download from the Internet, and create an APRS .BK file which you can load or
append with the F command. The current storm center will be plotted, with the
appropriate maximum wind radius,  and the projected track displayed as listed
in the warning.

612. APRS 7.4e Find Gridsquare problem

From: Mike Tyrrell <100321.1327@compuserve.com>
Date: 23 Jan 96 17:15:02 EST
To: "'aprs sig'" <aprssig@tapr.org>
Message-ID: <960123221501_100321.1327_JHF58-3@CompuServe.COM>
Rendered body type: text/plain

```
Hi,
I'm using APRS7.4e and was trying out the Operations, Find command. If I enter
the find string as my gridsquare  [IO83rg then the map cursor ends up at
gridsquare HM81lc off the west coast of Africa instead of in the UK!

Is this bug or have I misunderstood the way it should be used?

73

613. Altitude

From: mwalker@interlog.com (Mike Walker)
Date: Wed, 24 Jan 96 08:37:02 EST
To: aprssig@tapr.org
Message-ID: <199601241337.IAA27950@gold.interlog.com>
Rendered body type: text/plain

```
Hello All,
I was playing with the 3D window, and noticed that occasionaly I would get
altitude, and that the 3 mobiles I was watching out there were only very
occasionally sending altitude.

My question is, what sentance do I look for with my KPC3 so I send altitude all
the time, and that users could watch me go up and down hills?

I also noticed a couple of clitches in 74E.  I occasionally go away for the
weekend and leave the computer up in APRS (under os/2).  If someone sends be a
personal message, or the log file is saved, APRS will not beacon my posit
anymore until someone is around to hit the space bar.  There for, my computer
can sit idle all weekend, while we are driving around.

While in the Y screen, I will decrease the altitude to a max of 2000 ft (with
the F3 key).  If I redraw the screen with the space bar, the altitude scale
will reset to its original scale, and I have to move it down again with the F3
key.

Many thanks in advance...

cheers...mike

Ed-  Most of the Motorolas I have used require a preamped antenna.  We tried
one with a passive antenna (one of the helixes off a Garmin 45) and the
signals were pretty much useless.  It did receive, but never locked.

I recall that there was a version of the Moto that does have the first stage
onboard, but I have never seen one- especially surplus.

> If we're going to fly an APRS Satellite, we'd better look at channel loading
> Obviously the package couldn't serve as a simple space digipeater on 145.79.
> My suggestion is to develop a package that would transmit on 445.925 MHz...

WB4APR REPLY COMMENT:

Remember that the UHF satellite band is 435-438 MHz.  There would be a
world wide REVOLT if you used 445.925.  Remember, everytime you mention
445.925 MHz you are stirring up a hornets nest.  The only way to refer to
that frequency is *locally* and to use it only if it is available and can
get coordinated for APRS.  hi hi
```

>Bill KE4EER
>------------------

   Hello, William.

   At the risk of being pilloried for answering your questions, rhetorical
```

or implied, I will answer them. You asked them in this public forum. The following is what I "read ... out" of many of you messages. I qualify the following as personal opinion, from one who is far from perfect.

I have followed your writing for approximately a year? and have noticed a disturbing trend that you associate with others. You ascribe to others your own weaknesses! e.g. intolerance of others perceptions, (objective or subjective), strident and aggressive language, poor reading comprehension skills, flaming offered suggestions, etc.

As a reader of the SIG for some time, I get the distinct impression that your aggressive and intimidating style of expression would stifle contributions from the meeker among us.

I write this with some regret, for I appreciate your apparent creative accomplishments I read about in this SIG. You have appeared to have done more than most of us, and whatever my perceptions stated or otherwise, they do not
diminish your achievements in any way.

Your question, " Why does EVERYONE reads something out of my messages that is not there?" should suggest to you there may be something amiss, at home.

I know you are entitled to your opinions, your share of the rf spectrum, the fruits of your labor, and right to remind me that I can do other things if I do not like it, but, whatever your accomplishments, they do not justify your boorish behaviour.

Does a HI HI really impart humor to a broadside?

I will read your response, but for me the topic is closed.

I apologize to the other readers, but I felt compelled to express a view that has been brewing for a long time.

PS. Hello Jim, thanks for the welcome and an alternate view.

Pete, wa4hei

WB4APR REPLY COMMENT:

Yep, that bug appeared as soon as we got our first SPRE position report in Taiwan! Seems my OPS-FIND only works for the WEST hemisphere... It was fixed in APRtrak, but not yet in APRS... Sorry. WIll be soon...

WB4APR REPLY COMMENT:

APRS only gets altitude if it sees a GGA sentence...

APRS always resets the MAP SCREEN to defaults wehn you hit SPACE BAR.
You can RE-DRAW the map without defaults by pressing the HOME key (but if
you want the same map, be sure you havent moved the cursor.)

>   here)?

Tony-
Since I also have an Eagle Accunav Sport, I called the factory at (800)
324-1354 to get their response.  Apparently, the DISPLAY readout itself
is not limited to 100 knots since the 5-channel GPS engine used in it
(Rockwell NAVCORE V) can track unrestricted at typical aircraft speeds
and altitudes.  HOWEVER, for APRS work, the NMEA output string $GPRMC is
limited to 99.9 knots (roughly 115 MPH) and the unit unfortunately does
not output $GPGGA which normally provides altitude information as well.
Hope this clarifies the situation.

621. More Antennas

From: "TWEEDY, MIKE WH:2453" <tweedy@pc.gcs.litton.com>
Date: Wed, 24 Jan 96 09:51:55 -0800
To: aprssig@tapr.org
Message-ID: <FA2C063101B4ABAA@pc.gcs.litton.com>
Rendered body type: text/plain

```
Since there was a lot of discussion on the SIG re: availability of
low-cost L1 GPS antennas, I thought I would add some additional
information.  I found a place, Micro Pulse in Camarillo, Ca
(805-389-3446) that provides reasonably priced puck antennas, either
passive or with a built-in preamp.  I personally am using the 26 dB unit
in my motorhome with excellent results.  The units available are:

        1) P/N 90LL13800          26 dB gain     Unit price $77.95
        2) P/N 90LL13800-1      Passive          Unit price $64.95
        3) P/N 90LL13800-2      13 dB gain      Unit price $75.50

These antennas are available in either magnetic mount or screw mount and
uses a standard 10-ft length of RG 316.  They can be terminated in any
connector of your choice such as a BNC or MCX type.  Additional lengths
can be custom made at $1/foot additional charge.  The only thing you
should be aware of is that the preamp units require +5V on the coax
center pin to function.  I built an inline  power supply with a 7805
regulator, RF choke, and DC decoupling capacitor that works great with my
setup.  Hope this helps you guys out there---

I'm using the Motorola OnCore receiver with the onboard LNA for "Cows In
Space."  It works well, but there is not any reason to go with that sort of
thing if you're using the beast for mobile applications.  The current penalty
is small unless you're looking at long-duration battery operations, as we are.

Most designers incorporate a preamp at the antenna to overcome the limitations
of the coax they then link the antenna to the receiver with.  Since I'm using
about 12 inches of RG-174 (really!!) it's not a big issue for me.  15 feet of
```

RG-58 is a big hit, and just a meter of RG-174 shouldn't be done unless you know you're going to lose a lot of signal.

With preamp'd antennas, you get 20-40 dB (Trimble looks to get up to 44 dB!) at the antenna, and can afford to lose some on the way down.

73, gerry

>>My question is, what sentance do I look for with my KPC3 so I send altitude all
>the time, and that users could watch me go up and down hills?

$GPGGA has lon/lat and altitude.

but also send $GPRMC as SPEED and TRACK are more interseting and altitude is not very accurate with a regular GPS unit.

73

====================================
Analysis of the NMEA 0183 V2.0-dialect as spoken by the GPS45
brought together and partly revised by Sebastian Birnbach
(birnbacs@informatik.tu-muenchen.de). Please feel free to copy this text
and make sure you send me any addition or correction you have about it.

The GPS 45 outputs the following NMEA dataframes in cycles of approx. one every two seconds:

```
$GPGSV  GPS satellites in view
$PGRME  unknown
$GPGLL  GPS latitude and longitude
$PGRMZ  altitude above normal zero
$PGRMM  selected map datum
$GPBOD  GPS bearing, origin to destination
$GPWPL  GPS waypoint location (different WP of track 0 each cycle)
$GPRMC  GPS recommended minimum specific GPS/TRANSIT data
$GPRMB  GPS recommended minimum navigation information
$GPGGA  GPS fix data
$GPGSA  GPS DOP and active satellites
```

Since it's cyclic one cannot tell which sentence is the first ;-)

The sentences that start with "$GP" are regular GPS-sentences, those that start with "$P" are proprietary sentences. "$PGRM" probably stands for "proprietary GARMIN", so only the last letter is used to identify the sentence. The sentences in detail:

```
######################################################################

$GPGSV,2,1,08,01,40,083,46,02,17,308,41,12,07,344,39,14,22,228,45*75

- 5. RS-232 connections
- 6. About the author
  - 6.1 Acknowledgements

1. What is NMEA?

The National Marine Electronics Association is dedicated to the education and advancement of the marine electronics industry and the market which it serves.

It is a non-profit association composed of manufacturers, distributors, dealers, educational institutions, and others interested in peripheral marine electronics occupations
(quoted from a promo in "NMEA News")

1.1 What is an NMEA standard?

For the purposes of this article, an NMEA standard defines an electrical interface and data protocol for communications between marine instrumentation. (They may also have standards for other things.)

1.2 NMEA Address

P.O. Box 3435
New Bern NC, 28564-3435
U.S.A.
Phone: 919-638-2626
Fax: 919-638-4885
http://www.coastalnet.com/business/electronics/nmea/nmeawww.html

2. Electrical Interface

These standards allow a single "talker", and several "listeners" on one circuit. The recommended interconnect wiring is a shielded twisted pair, with the shield grounded only at the talker. The standards do not specify the use of any particular connector.

The NMEA-0180 and 0182 standards say that the talker output may be RS-232, or from a TTL buffer, capable of delivering 10 mA at 4 V. A sample circuit shows an open collector TTL buffer with a 680 ohm resistor to +12 V, and a diode to prevent the output voltage from rising above +5.7 V.

NMEA-0183 accepts this, but recommends that the talker output comply with EIA-422. This is a differential system, having two signal lines, A and B. The voltages on the "A" line correspond to those on the older TTL single wire, while the "B" voltages are reversed (while "A" is at +5, "B" is at ground, and vice versa)

In either case, the recommended receive circuit uses an opto-isolator with suitable protection circuitry. The input should be isolated from the receiver's ground.

In practice, the single wire, or the EIA-422 "A" wire may be directly connected to a computer's RS-232 input.

3. NMEA-0180 and NMEA 0182

NMEA-0180 and 0182 are very limited, and just deal with communcations from a Loran-C (or other navigation receiver, although the standards specifically mention Loran), and an autopilot.

From the information I have, it appears that 0180 and 0182 are identical. I suspect that equipment claiming to use NMEA-0180 will use the "simple" format described below, while those using NMEA-0182 will use the "complex" format. (but this is really just a guess... corrections??)

3.1 "Simple" data format

The simple format consists of a single data byte transmitted at intervals of 0.8 to 5 seconds, at 1200 baud with odd parity. Bits 5 - 0 give the cross-track error in units of 0.1 uS or 0.01 nautical mile. The error is given in offset binary, with a count of 1 representing full scale right error, 32 (hex 20) for on course, and 63 (hex 3f) full scale left error. Bit 6 is a 1 if the data is valid, and bit 7 is 0 to indicate the simple data format.

3.2 "Complex" data format

The complex format consists of a data block of 37 bytes of (mostly) readable ASCII text giving cross-track error, bearing to waypoint, present Lat/Long, and a binary status byte. The data block shall be sent at intervals of 2 to 8 sec. All bytes in the complex format have bit 7 = 1 to distinguish them from the simple format. It is permissible for a sending device to send both simple and complex data, and even to send a "simple" data byte in the middle of a "complex" data block.

Byte	Data	
1	$	
2	M	device
3	P	address
4	K = kilometres N = nautical miles U = microseconds	cross track error units
5 - 8	0 - 9 or .	cross track error value
9	L or R	cross track error position
10	T or M	True or Magnetic bearing
11 - 13	0 - 9	bearing to next waypoint
14 - 23	12D34'56"N or 12D34.56'N	present latitude
24 - 34	123D45'56"W or 123D45.67"W	present longitude
35	non-ASCII status byte bit 0 = 1 for manual cycle lock 1 = 1 low SNR 2 = 1 cycle jump 3 = 1 blink 4 = 1 arrival alarm 5 = 1 discontinuity of TDs 6 = 1 always	
36	"NUL" character (hex 80)(reserved status byte)	
37	"ETX" character (hex 83)	

Any unavailable data is filled with "NUL" bytes.

4. NMEA-0183

4.1 General Sentence Format

Under the NMEA-0183 standard, all characters used are printable ASCII text (plus carriage return and line feed).

The data is transmitted in the form of "sentences". Each sentence starts with a "$", a two letter "talker ID", a three letter "sentence ID", followed by a number of data fields separated by commas, and terminated by an optional checksum, and a carriage return/line feed. A sentence may contain up to 82 characters including the "$" and CR/LF.

If data for a field is not available, the field is simply omitted, but the commas that would delimit it are still sent, with no space between them.

Since some fields are variable width, or may be omitted as above, the receiver should locate desired data fields by counting commas, rather than by character position within the sentence.

The optional checksum field consists of a "*" and two hex digits representing the exclusive OR of all characters between, but not including, the "$" and "*". A checksum is required on some sentences.

The standard allows individual manufacturers to define proprietary sentence formats. These sentences start with "$P", then a 3 letter manufacturer ID, followed by whatever data the manufacturer wishes, following the general format of the standard sentences.

Some common talker IDs are:

GP	Global Positioning System receiver
LC	Loran-C receiver
OM	Omega Navigation receiver
II	Integrated Instrumentation (eg. AutoHelm Seatalk system)

4.2 Sentences sent by specific equipment

This section lists the sentence types used by various equipment. The format and data included in each sentence type is given in section 4.3.

Eagle AccuNav
Standard: RMB, RMC, GLL, APB
Proprietary: PSLIB
It also pretends it's a Loran, sending LCGLL, as well as GPGLL

Garmin GPS-45 (and probably GPS-40 and GPS-90)
Standard: BOD, GLL, RTE, RMB, RMC, GGA, GSA, GSV
Proprietary: PGRME, PGRMM, PGRMZ

Garmin GPS-65 (and probably GPS-75)
Standard: BWC, GLL, RMB, RMC, R00, WPL, XTE, VTG
Proprietary: PGRMM, PGRMZ, PSLIB

Magellan Trailblazer
Standard: APB, BWC, GGA, GLL, RMB, RMC, VTG
Trimble Ensign XL
Standard: APA, BWC, BWR, GGA, GLL, RMB

Trimble Flightmate Pro and Scoutmaster
Standard: APA, APB, BWC, GGA, GLL, GSA, GSV, RMB, RMC, VTG, WCV, XTE, ZTG

Autohelm Seatalk

Autohelm Seatalk is a proprietary bus for communications between various intruments. Some of the instruments can act as NMEA-0183 talkers or listeners. Data received from an external NMEA-0183 device will, if Seatalk understands the sentence, be re-transmitted, but not necessarily in the same sentence type.

The specific sentences sent will depend on the data available on the Seatalk bus (i.e. sentences containing wind speed and direction will only be sent if the system includes a wind instrument)

Seatalk output:
Standard: APB, BPI, BWC, VWR, VHW, DBT, GLL, HDM, HDT, HCS, MTW, VTG

Seatalk input:
Standard: APA, APB, RMB, XTE, XTR, BPI, BWR, BWC, BER,

BEC,WDR, WDC, BOD, WCV, VHW, VWR, DBT

4.3 Sample Sentences Dissected

4.3.1 Standard Sentences

A talker typically sends a group of sentences at intervals determined by the unit's update rate, but generally not more often than once per second.

Characters following the "*" are a checksum. Checksums are optional for most sentences, according to the standard.

APB - Autopilot format B

APB,A,A,0.10,R,N,V,V,011,M,DEST,011,M,011,M

A	Loran-C blink/SNR warning
A	Loran-C cycle warning
0.10	cross-track error distance
R	steer Right to correct (or L for Left)
N	cross-track error units - nautical miles
V	arrival alarm - circle
V	arrival alarm - perpendicular
011,M	magnetic bearing, origin to destination
DEST	destination waypoint ID
011,M	magnetic bearing, present position to destination
011,M	magnetic heading to steer (bearings could be given in True as 033,T)

(note: some pilots, Roberston in particular, misinterpret "bearing from origin to destination" as "bearing from present position to destination". This apparently results in poor performance if the boat is sufficiently off-course that the two bearings are different.)

BOD - Bearing - origin to destination waypoint

BOD,045.,T,023.,M,DEST,START

045.,T	bearing 045 True from "START" to "DEST"
023.,M	breaing 023 Magnetic from "START" to "DEST"
DEST	destination waypoint ID
START	origin waypoint ID

BWC - Bearing and distance to waypoint - great circle

BWC,225444,4917.24,N,12309.57,W,051.9,T,031.6,M,001.3,N,004*29

225444	UTC time of fix 22:54:44
4917.24,N	Latitude of waypoint
12309.57,W	Longitude of waypoint
051.9,T	Bearing to waypoint, degrees true
031.6,M	Bearing to waypoint, degrees magnetic
001.3,N	Distance to waypoint, Nautical miles
004	Waypoint ID

BWR - Bearing and distance to waypoint - rhumb line

(format same as BWC)

DBT - Depth below transducer

DBT,0017.6,f,0005.4,M

0017.6,f	17.6 feet
0005.4,M	5.4 Metres

GGA - Global Positioning System Fix Data

GGA,123519,4807.038,N,01131.324,E,1,08,0.9,545.4,M,46.9,M, , *42

123519	Fix taken at 12:35:19 UTC
4807.038,N	Latitude 48 deg 07.038' N
01131.324,E	Longitude 11 deg 31.324' E
1	Fix quality: 0 = invalid 1 = GPS fix 2 = DGPS fix
08	Number of satellites being tracked
0.9	Horizontal dilution of position
545.4,M	Altitude, Metres, above mean sea level
46.9,M	Height of means sea level above WGS84 geoid
(empty field)	time in seconds since last DGPS update
(empty field)	DGPS station ID number

GLL - Geographic position, Latitude and Longitude

GLL,4916.45,N,12311.12,W,225444,A

4916.46,N	Latitude 49 deg. 16.45 min. North
12311.12,W	Longitude 123 deg. 11.12 min. West
225444	Fix taken at 22:54:44 UTC
A	Data valid

```
     (Garmin 65 does not include time and status)

GSV - Satellites in view
GSV,2,1,08,01,40,083,46,02,17,308,41,12,07,344,39,14,22,228,45*75
   2           Number of sentences for full data
   1           sentence 1 of 2
   08          Number of satellites in view
   01          Satellite PRN number
   40          Elevation, degrees
   083         Azimuth, degrees
   46          Signal strength - higher is better
   <repeat for up to 4 satellites per sentence>
        There my be up to three GSV sentences in a data packet

HDM - Heading, Magnetic
HDM,235.,M
   HDM         Heading, Magnetic
   235.,M      Heading 235 deg. Magnetic
    (HDG, which includes deviation and variation, is recommended
    instead)

HSC - Command heading to steer
HSC,258.,T,236.,M
   258.,T      258 deg. True
   236.,M      136 deg. Magnetic

MTW - Water temperature, Celcius
MTW,11.,C
   11.,C       11 deg. C

R00 - List of waypoint IDs in currently active route
R00,MINST,CHATN,CHAT1,CHATW,CHATM,CHATE,003,004,005,006,007,,,*05
   (This sentence is produced by a Garmin 65, but is not listed
   in Version 2.0 of the standard.  The standard lists RTE for
   this purpose.)

RMB - Recommended minimum navigation information (sent by nav.
        receiver when a destination waypoint is active)
RMB,A,0.66,L,003,004,4917.24,N,12309.57,W,001.3,052.5,000.5,V*0B
   A           Data status A = OK, V = warning
   0.66,L      Cross-track error (miles), steer Left to correct
   003         Origin waypoint ID
   004         Destination waypoint ID
   4917.24,N   Destination waypoint latitude 49 deg. 17.24 min. N
   12309.57,W  Destination waypoint longitude 123 deg. 09.57 min. W
   001.3       Range to destination, nautical miles
   052.5       True bearing to destination
   000.5       Velocity towards destination, knots
   V           Arrival alarm  A = arrived, V = not arrived
   *0B         mamdatory checksum

RMC - Recommended minimum specific GPS/Transit data
RMC,225446,A,4916.45,N,12311.12,W,000.5,054.7,191194,020.3,E*68
   225446      Time of fix 22:54:46 UTC
   A           Navigation receiver warning A = OK, V = warning
   4916.45,N   Latitude 49 deg. 16.45 min North
   12311.12,W  Longitude 123 deg. 11.12 min West
   000.5       Speed over ground, Knots
   054.7       Course Made Good, True
   191194      Date of fix  19 November 1994
   020.3,E     Magnetic variation 20.3 deg East
   *68         mandatory checksum

RTE - Waypoints in active route
RTE,2,1,c,0,W3IWI,DRIVWY,32CEDR,32-29,32BKLD,32-I95,32-US1,BW-32,BW-198*69
   2           two sentences for full data
   1           this is sentence 1 of 2
   c           c = complete list of waypoints in this route
               w = first listed waypoint is start of current leg
   0           Route identifier
   W3IWI...    Waypoint identifiers

VHW - Water speed and heading
VHW,259.,T,237.,M,05.00,N,09.26,K
   259.,T      Heading 259 deg. True
   237.,M      Heading 237 deg. Magnetic
   05.00,N     Speed 5 knots through the water
   09.26,K     Speed 9.26 KPH
```

VWR - Relative wind direction and speed
VWR,148.,L,02.4,N,01.2,M,04.4,K

148.,L	Wind from 148 deg Left of bow
02.4,N	Speed 2.4 Knots
01.2,M	1.2 Metres/Sec
04.4,K	Speed 4.4 Kilometers/Hr

VTG - Track made good and ground speed
VTG,054.7,T,034.4,M,005.5,N,010.2,K

054.7,T	True track made good
034.4,M	Magnetic track made good
005.5,N	Ground speed, knots
010.2,K	Ground speed, Kilometers per hour

WCV - Waypoint Closure Velocity
WDC - Distance to Waypoint
WDR - Waypoint Distance, Rhumb Line

WPL - waypoint location
WPL,4917.16,N,12310.64,W,003*65

4917.16,N	Latitude of waypoint
12310.64,W	Longitude of waypoint
003	Waypoint ID

When a route is active, this sentence is sent once for each waypoint in the route, in sequence. When all waypoints have been reported, GPR00 is sent in the next data set. In any group of sentences, only one WPL sentence, or an R00 sentence, will be sent.

XTE - Cross track error, measured
XTE,A,A,0.67,L,N

A	General warning flag V = warning (Loran-C Blink or SNR warning)
A	Not used for GPS (Loran-C cycle lock flag)
0.67	cross track error distance
L	Steer left to correct error (or R for right)
N	Distance units - Nautical miles

XTR - Cross-Track Error - Dead Reckoning
XTR,0.67,L,N

0.67	cross track error distance
L	Steer left to correct error (or R for right)
N	Distance units - Nautical miles

4.3.2 Proprietary Sentences

The following are Garmin proprietary sentences. "P" denotes proprietary, "GRM" is Garmin's manufacturer code, and "M" or "Z" indicates the specific sentence type.

$PGRMZ,93,f,3*21

93,f	Altitude in feet
3	Position fix dimensions 2 = user altitude 3 = GPS altitude

This sentence shows in feet, regardless of units shown on the display.

$PGRMM,NAD27 Canada*2F
Currently active horizontal datum

Proprietary sentences to control a Starlink differential beacon receiver. (I assume Garmin's DBR is made by Starlink)
$PSLIB,,,J*22
$PSLIB,,,K*23

These two sentences are normally sent together in each group of sentences from the GPS.
The three fields are: Frequency, bit Rate, Request Type. The value in the third field may be:

J = status request
K = configuration request
blank = tuning message

When the GPS receiver is set to change the DBR frequency or baud rate, the "J" sentence is replaced (just once) by (for example): $PSLIB,320.0,200*59 to set the DBR to 320 KHz, 200 baud.

5. RS-232 connections

Although this is not really related to NMEA, many people want to connect a GPS to a computer, so need to know about the RS-232 serial ports on a computer.

The RS-232 standard defines two classes of devices that may communicate using RS-232 serial data - Data Terminal Equipment (DTE), and Data Communication Equipment (DCE). Computers and terminals are considered DTE, while modems are DCE. The standard defines pinouts for DTE and DCE such that a "straight through" cable (pin 2 to pin 2, 3 to 3, etc) can be used between a DTE and DCE. To connect two DTEs together, you need a "null modem" cable, that swaps pins between the two ends (eg. pin 2 to 3, 3 to 2). Unfortunately, there is sometimes disagreement whether a certain device is DTE or DCE, hence my standard RS-232 disclaimer:

if it doesn't work, swap pins 2 and 3!

The standard RS-232 connector is a 25 conductor DB-25, although many PCs (and some other equipment) now use a 9 pin DE-9 (often incorrectly called DB-9)

Serial Port Connections

Computer (DTE)				Modem
DB-25	DE-9	Signal	Direction	DB-25
2	3	Tx Data	->	2
3	2	Rx Data	<-	3
4	7	Request to send	->	4
5	8	Clear to send	<-	5
6	6	Data Set Ready	<-	6
7	5	signal ground		7
8	1	Data CarrierDetect	<-	8
20	4	Data Terminal Ready	->	20
22	9	Ring Indicator	<-	22

For NMEA-0183 interfacing, we are only concerned with Rx Data, signal ground (and possibly Tx Data, if we want the computer to talk to the GPS)

6. About the author

This FAQ was written by:
Peter Bennett
bennett@triumf.ca

I have an FTP site containing this file, a GPS FAQ, and other NMEA information files and PC programs for capturing and displaying NMEA data, and related things:

ftp://sundae.triumf.ca/pub/peter/index.html

Rendered body type: text/plain

```
Greetings and felicitations!

     I received in yesterday's post a connector from Larry Berg of Purple
     Computer in Oregon.  My FREE GPS45 power/data connector!!!

     Tried it out, and it seems to be just fine.  A little heat shrink, a
     bit of glue, and voila! it will be a fine addition to my cable
     collection, and at an excellent price.  Free.  A much better price
     than my official Garmin cable, which cost me ~30 smackeroos.

     This is another reason why I prefer the GPS45.  Whatever its
     limitations, it has a growing support group through which goodies are
     to be had.

     Thanks Larry.

     73 - Jon NW6H

I must have missed something along the way here abt WINAPRS and maps.
Here is some text from a previous message:

MacAPRS and WinAPRS use the EXACT same format for the map files.

This format is a BINARY format, and although not proprietary or secret,
is not something that you can make maps for by hand..

MacAPRS and WinAPRS will read the PC/DOS APRS map files DIRECTLY,
NO CONVERSION NEEDED!

The maps for the DOS ver of APRS are all of numbers and the maps for the
MacAPRS are all of binary format. SO how can these two be the same?
I thought I read that the DOS maps would work with WINAPRS but I am sure
that this would result in the same looking map screens as the present APRS
screen and NOT what I have seen in the WINAPRS demo's that are white
backgrounded and quite detailed.

Perhaps what is being said is that WINAPRS will read the present APRS DOS
maps, but if you want the nice stuff, you got to use the MacMaps?

                                  \\\\

Yeah, 445.925MHz in SoCal is a repeater channel.  There'd be hell to
     pay with that.  However, the idea is good, and I'd be real interested
     in being part of a group that built and delivered such a widget!  What
     about using 900 or 1200MHz?  What are the possibilities there?  What's
     the international allocations?

     73 - Jon NW6H

WB4APR REPLY COMMENT:

Remember that the UHF satellite band is 435-438 MHz.  There would be a
world wide REVOLT if you used 445.925.  Remember, everytime you mention
445.925 MHz you are stirring up a hornets nest.  The only way to refer to
that frequency is *locally* and to use it only if it is available and can
get coordinated for APRS.  hi hi

According to the Eagle Rep and the factory the sky is the limit and
they say speed is somewhere around 999 miles per....I do not know
how accurate this info is I have never tried it, this is just the
info I get from the factory rep. 73 and enjoy..

Jon:

I got mine yesterday, too, but haven't been able to find the time yet to play with it. I suggested to Larry that a bunch of locals around here (Fairfield Cty, CT) might be interested in a group purchase if he would care to name a price. He said he'd consider it.

I wish to stress that Larry designed the plug from scratch using CADS, designed and built an injection mold for the plug (!) and then molded a bunch of them, added some pins, then sent them out to whoever asked for them. What a guy!! He deserves some praise.

He didn't know about aprssig, by the way, so I told him as much as I deemed might interest him. He's a ham. He uses GPS for piloting his ultralight. We can only hope some day to see a signal from him on APRS. I don't know if he was serious, but he said he was thinking about flying it to Hawaii (I can only assume he'll use a chase boat... he lives in the Pacific Northwest). Now that would be a signal I'd watch on HF...

635. U-2000, HSP and AEA Fixes

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 24 Jan 1996 18:19:54 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960124180452.15380A-100000@greatlakes>
Rendered body type: text/plain

I finally tore into APRS74e and still can find nothing that would cause the lockups on some of your machines and not on mine.

I am convinced that all of these problems are related to the 16550 fast UARTs with their built in FIFO buffers. Someone posted how to turn on/off these buffers in your windows setups, but I cant find the message.

If you are having any of the following problems, then please confirm whether your FIFO buffers are on or off, and try it both ways. I dont want to fix something the wrong way that ain't fully broke...

If your U-2000 locks up your APRS
If your HSP will lockup if it doesnt get a VTG
If your fancy TNC gets locked up

After I get your responses, then repairs to 74e will continue.. BUGS already fixed:
1) Space mode anomolies noticed with SPRE
2) OPS-FIND Grid Sq
3) More filters to reject NETROM and other non APRs packets
4) AEA's would not plot 9 character calls!
5) Alternate NWS WX syms are back

If there are any other bugs that you can quantify, or have told me about but are not in the above list, remind me. Thanks...

636. Re: [APRSSIG:6240] Re: GPS antennas

From: "Jon T Adams" <Jon.T.Adams@jpl.nasa.gov>
Date: 24 Jan 1996 14:51:01 -0800
To: "aprssig@tapr.org" <aprssig@tapr.org> (Return requested),
"gerry@cs.tamu.edu" <gerry@cs.tamu.edu> (Return requested)
Message-ID: <0476F3106B7D5006*/c=us/admd=telemail/prmd=nasa/o=jpl/ou=ccmail/s=Adams/g=Jon/i=T/@MHS>
Rendered body type: text/plain

Gerry sez:

Most designers incorporate a preamp at the antenna to overcome the limitations of the coax they then link the antenna to the receiver with. Since I'm using about 12 inches of RG-174 (really!!) it's not a big issue for me. 15 feet of RG-58 is a big hit, and just a meter of RG-174 shouldn't be done unless you know you're going to lose a lot of signal.

With preamp'd antennas, you get 20-40 dB (Trimble looks to get up to 44 dB!) at the antenna, and can afford to lose some on the way down.

73, gerry

> The major concern that all hams in this SIG should have with any GPS receiver is the ability of that receiver to withstand local high-power transmitters. GPS receivers (at least the ones that I've played with) are not immune to RFI from ham transmitters (see my earlier post).
>
> Adding an preamp in the antenna cuts losses in the downstream coax, but can exacerbate local transmitter interference. (Of course, the internal LNA in the GPS unit can suffer the same effects, but it generally has a poorer antenna and less proximity to the transmitter antenna, so the total interference power is lower.)
>
> There are two primary reasons why this happens: The first is the response of the receiver front end to signals outside of the band of interest. If the amplifier is seeing large, out-of-band signals that steal most of its gain, then the darned thing won't amplify the signal of interest, namely the GPS satellite. It could also be generating mix products inside the preamp transistor or in the GPS receiver itself. These products may also pollute the GPS receiver. Both can be controlled with adequate preselector filtering before the first gain element of the receiver. However, the front ends of many of these GPS receivers employ little more than the antenna as a bandpass filter. They are generally designed without an RF environment in mind (like everything else).
>
> The second primary cause comes from transmitter white noise, spurious signals and harmonics generation. The 11th harmonic of a transmitter at 143.2 MHz is in the middle of the GPS channel. The 7th harmonic of a 225.0MHz transmitter is dead on channel. The 14th harmonic of the 4th subharmonic of a 450 MHz tranmitter is also right on channel, ad infinitum. Generally, none of these harmonics are large in amplitude compared to the carrier (-50 to -90dBC) but in terms of absolute signal level, they're huge compared to the GPS signal. So if it's a starved LNA (gotta keep the power low) the thing could easily get swamped by even a small harmonic.
>
> Transmitters produce white noise. This is thermal noise generated in the transmitter stages that is generally reduced by the output bandpass filter. But if the bandpass filter is not designed for working up to light frequencies, then the filter stops performing somewhere and the transmitter white noise leaks out.
>
> Tranmitters produce non-harmonic spurs. These puppies show up all sorts of

places and can play havoc.

What can you do about the transmitter-generated ones? Well, a GPS receiver bandpass filter can help if it's white noise or off-channel spurs or harmonics. But for the three harmonic examples above, there ain't nothing the receiver can do with a simple filter. You need to put the filter on the transmitter.

What does all this mean? You're not gonna find out any of this info by talking to the salesperson, or generally even a company lackey. Be prepared for some unexpected surprises no matter what your configuration is. Look for external antenna/preamps with some selectivity (out of band rejection). Get folks to improve the design of GPS antennas to make them more narrow band and thus somewhat less susceptible to RFI.

> I must have missed something along the way here abt WINAPRS and maps.
> Here is some text from a previous message:
>
<snip>

Sorry for the confusion..

The PC/DOS APRS maps are text files and CAN be created by hand (But who would want to?)

WinAPRS/MacAPRS map files are in binary, Therefore, the load quicker, and the TYPICAL map from the Macintosh is anywhere from 10,000 points to 50,000 points. (The ONLY limitation in size is how much memory you have available)

If you have PC/DOS APRS maps that you like, you can simply put them into the MAPS folder for WinAPRS (or MacAPRS) and when you run the program it will see them and use them..

Also, YOU DO NOT NEED THE MAPLIST file anymore!!!!!!!!

> Perhaps what is being said is that WINAPRS will read the present APRS DOS
> maps, but if you want the nice stuff, you got to use the MacMaps?

This is a good way of putting it...

Also, I have now started putting all NEW maps up on TAPR in ZIP format so that the PC/DOS/Windows people have an easier time at downloading them. (ZIP is easy for the Mac to handle, but STUFFIT (*.SIT files) is tougher for the PC to handle..

639. UHF controversy starting again?

From: rwf <rwf@mindspring.com>
Date: Wed, 24 Jan 1996 20:34:54 -0500
To: aprssig@tapr.org
Message-ID: <199601250134.UAA28114@borg.mindspring.com>
Rendered body type: text/plain

To KU0G and the rest of the bunch:

UhOh... I KNOW your message will leak to the frequency coordinator's remailer (there is someone here leaking messages that mention "standard" frequencies). Most of the time the messages just concern mundane stuff like using 56k backbones, etc- but this one will get them stirred up! But that's what you said you wanted to do.

I have a role with a very large coordinator, but it does not include packet. As a matter of fact- that coordinator does not do packet. Packet is handled by the individual states within that region.

This 445.925 subject came up before, and caused quite a stir. As I understand it- it is a repeater input (or pssible output) out West. In our area, I *think* it may be within a high speed 100KHz packet channel(won't be sure 'til I look at the bandplan.)

What I am saying is that we need to explore concepts, not actual frequencies at this point. Once we have our concept, we will need to work with ALL coordinators to decide upon the best frequency to use. To quote a previous message I saw: "445.925 just happens to be clear in a small town in Maryland".

Please don't stir something up that will put all coordinators on the defensive again.

Extensive planning is how Amsat and Mir came up with the frequencies they use, and there are *still* conflicts.

I don't think we should be mentioning specific frequencies at this point!

By the way- I have my APRS hat on as I write ths message, while listening with a coordinator's ear.

While I also threw away that message, I did upload a program to the TAPR APRSSIG FTP site called 16550.ZIP

This is a DOS program that will turn on your 16550 buffers, and even detect if you have a 16550 UART installed in your machine in the first place.

Cheers-

Mark (who is looking for a cheap PK-232MBX w/Pactor, BTW)

Thanks Pete! I couldn't have said it better!

But Pete, he hasn't been on the SIG for a year... ITS ONLY BEEN
364.93628 DAYS! WHATS THE MATTER WITH YOU? CAN'T YOU
COUNT, OR WERE YOU JUST BROUGHT UP WRONG? <snicker>

I have emailed Bill several times asking him to restrict his personal
differences to private email rather than spewing them onto the sig.
Each time, the responses were thrown back in my face. I think you
are right in saying that he probably stifles contributions from some
of us. Hopefully he'll get the hint and either lighten up or leave.

Rendered body type: text/plain

Unfortunately the Davis Instruments equipment uses a proprietary data format with attendant restrictions and so is not supported by APRS. The Peet Brothers Instruments send data in an ascii format that can be decifered and used by APRS.

Alan, et al. I have a Davis weather station which I got about a year before
I found out about APRS. The weather station is great, but I think I've seen
Bob B. say that Davis will not release any information about their data
formats and interface - it is "proprietary"! At any rate, I have not even
tried to interfact the Davis station to APRS yet. If anyone has any firmer
information, please speak up!

Davis should look around - seems like essentially every company of late that
tries to hold onto a "proprietary" position gets left in the dust!

The Davis is a very fine WX system and I've had one prior to APRS. After APRS
became widespread I called Davis about their interface spec, and they said
it was proprietary and they weren't releasing it. They weren't interested in
pursuing it themselves. Unless something has changed, it's not usable for
APRS. Too bad.

652. Garmin vs Eagle Debate

From: Randy Hammock <hammock@tis.telos.com>
Date: Thu, 25 Jan 1996 09:34:39 -0500 (EST)
To: APRSSIG <aprssig@tapr.org>
Message-ID: <Pine.SOL.3.91.960125084127.17798A-100000@zentropa>
Rendered body type: text/plain

I though long and hard before sending in a response to the on-going
debate. One must look at the relative merrits of each system and choose
the one that best meets the desired criteria.

Since I planned not only to use my unit for APRS (mobile w/ inexhaustable
power source) but for horseback trail mapping, I needed a unit that was
power efficient, worked with co-ordinates system other than LAT/LON,
supported many different map datums, the ability to remotely mount the
antenna (antenna mounted on top of riding helmet), lots of waypoints,
large track buffer, the ability to up/down-load the track buffer and
waypoints, and reasonable performance in the woods.

```
GPS Unit:               Garmin GPS-45
```

Position Formats: UTM/UPS
British Grid
Irish Grid
German Grid
Swedish Grid
Swiss Grid
hddd.ddddd
hddd mm.mmm'
hddd mm'ss.s"

Map Datums: 105

Units Displayed: Statute
Nautical
Metric

Battery Count: 4 AA

Battery Life: 10-20 hours

Track Buffer: 768 Data points

Waypoints: 250

Routes: 10

NMEA Compatability: YES

Up/Down-load Track Buf: YES/YES

Up/Down-load Waypoints: YES/YES

Up/Down-load Routes: YES/YES

External Antenna: YES

Performance in Woods: Good (w/supplied antenna)

I'm afraid that I cannot fill-in the chart for the Eagle, but I can remember that the Eagle does not support UTM co-ordinates, does not support the use of an external antenna and is a power hog (sucking 6 AA battery dry in 3-4 hours, maybe 6). That makes the Eagle not only more expensive to buy but to operate as well. Not supporting UTM grids makes the Eagle that much more difficult to use in the field, too.

As has been mentioned before by others, the Eagle may be a superior unit running mobile APRS, it is not necessarily the most desirable unit for trekking or horsing around.

As an experiment, and to stir up more interest in the Chicago area, the DuPage Amateur Radio Club (W9DUP) will be taking check-ins on VHF aprs in conjunction with our regular voice net on 145.25 MHz. The net will start at 0200 UTC (9:00 PM CST) sunday night 1/28/96.
PROCEDURE: Transmit name & QTH to W9DUP
When (and if) you get an ACK back, consider yourself checked in.
HF and VHF station are encouraged to participate. So as to keep qrm to a minimum, VHF stations should send only once or twice (you may not get an ACK).
Show your support for aprs by checking in. I will post check-in totals and calls next week.

Perhaps we just want to show off since Keith and Mark will be here for the public beta release of WinAPRS. Perhaps we just want to see if a cross country net could be done via APRS. Either way, it should be very interesting. Hope to see you on the screen.

Rendered body type: text/plain

```
For those still questioning the importance of an external GPS antenna read
this. I was just monitoring Ed's KE4ROC's mobile setting at his work qth parking
lot beaconing with the gps on the dashboard. Some are saying you will get a
natural induced error that will show you a circle of beacons when zoomed in to
his position well i just checked on the distance of his beacon and it was
13 MILES NE of his actual position. Don't think that's normal, or that would
ever happen if he had an external antenna.

Now on another subject for those running Davis WX station, Ed KE4ROC the
same person in the above message has been running a Davis onto APRS for
some time now at his NASA work qth here in Huntsville,AL Ed wrote some
software in C++ for Windows 95 to collect WX information from all WX stations
```

on VHF within reach of stations in our area. Ed is not on this sig, or maybe
just lurking i don't know. You may be able to contact him by snail mail, and
he maybe talked into sharing his software with you. He's a great guy (Gosh i
hope he doesn't see this) but not very active on APRS othger then he has
2 WX stations up and running and also has a 24HR GPS system with laptop.

The SMC corp shipped a LOT of defective dual 16550's with a part # of
SMC665, these appeared on both cards and MB's. The failure mode was to lock
up the computer and had something to do with previous data left in the
buffer when enabled. The good news is there is a fix for windows (not sure
about dos) floating arround. The bad news is I can't remember the name.
SMC knowingly shipped these defective parts and I have access to a internal
memo that proves it. Rotten bastards.

It was discussed and it was mentioned that we had started this capibility
in MacAPRS, It MIGHT be added in WinAPRS but IF we do it all, it wont be
until the end of the year. At present it is implemented in MacAPRS but not
completely finished. Once it is finished and we determine how useful it
is, then we will consider doing to for WinAPRS.

Yes Keith i would also like to know more about mapmaking for WinAprs. will
their be any software available for using the current 1:100 K Cd to make bigger
and better local maps. I downloaded the maps you mentioned from Tapr but
didn't see anything in that file that would cover anything local to any of us
here in the South East where there are many many users. I sure wouldn't
want to depend on having to look for somebody with a Mac to make my maps
for me Hi. Sure would love some advanced detail on mapmaking instead of
getting a BIG shock all at once Hi. For one who has made more then 500
detailed maps would like to know.

At the risk of getting my ears pealed again...

The location of the antenna is of little consequence IF a sufficient number of
satellites are visible to provide adequate geometry for calculation of a 2D or
3D fix.  Assuming the antenna is located so that at lease 1/2 the sky is
visible, you *should* be able to acquire enough satellites to get at least a
2D position.

If the receiver calculates a position with N satellites (usually 3 for a 2D
fir, 4 for a 3D fix, but your mileage may vary [And, yes, I know that some use
more... but none can use less]) it also calculates a Dilution of Precision, or
DOP number.  This number is unit-less, and is referenced so that a best
solution geometry produces a DOP of 1.0, while a larger number indicates a
poorer geomentry, or goodness of the navigation solution.

In general terms, a DOP <1.0 is meaningless, and a DOP of 0 usually indicates
the receiver is not generating a valid position solution.

Common mode system errors in the receiver, the various spacecraft and the
groundstations conspire to reduce the precision of the position soution.  In
the best of circumstances, using C/A (L1) code, which is what most of us use
with the consumer-grade hardware, you can hope for an error of 5-15 meters for
a short term position fix.  Averaging over a longer period should improve the
solution, as common mode, non-induced error is random and approximating a
Guassian distribution.  An average over a period of 1023 seconds, with good
satellite geometry throughout, should yield a position solution with an error
of 0.5-1.5 meters (1 order of magnitude better).  All of this assumes that
Selective Availability is _NOT_ operating, and no attempts are made to degrade
teh constellation or its performance.

In short term position solutions, the appearance will be that the vehicle is
wandering about a point, although it will usually be a small area of
migration.  Or, in other words, even with SA off, the vehicle will appear to
wander about an error ellipse (NOTE: A circle is a special case of an
ellipse.).

When the DoD incurs Selective Availability, they attempt to deceive the GPS
receiver by telling the satellites to report a different GPS time and/or a
different set of instantaneous positioning data, by modifying the satellite
ephemeris data.  The net result of this is that the position solution derived
from a set of satellites affected by SA is to increase the apparent degree of
position error to between 30 meters and 100 meters, 95% of the time.  By its
nature, SA causes the error to wander in some direction over a time interval
of several to many seconds, but not to necessarily exactly reverse its course,
and pass back through a true solution matrix possibility.

Unlike the non-perturned GPS signal, SA-perturbed position solutions cannot be
refined by simple averaging.  Application of a digital filter, such as that
described by Kalman, is usually required to remove the noise associated with
the techniques used by SA to achieve data that can be tracked in that manner.

The error ellipse resulting from an SA-perturbed position solution is
significantly larger than that derived from an unperturbed solution.  Further,
```

by its nature it will only appear symmetrical over a long period of time, of say, 24 to 48 hours duration.

One of the complications one encounters when one has an inadequate antenna situation is that of multipath. In some instances, a signal may reach the antenna after having taken the "long way around" reflecting off one or more surfaces, rather than coming directly to the antenna. This delay may well be long enough to cause some induced error in the position solution. Further, in some instances, the signal may reach the antenna after multiple reflections, and find itself getting there several times, and out of phase. The resulting confusion to the receiver can cause a myriad of problems in the solution matrix.

An error of 13 miles is not consistent with a GPS receiver which meets ICD-GPS-200 specs receiving satellites and having adequate satellites visible to achieve a solution. It would seem more likely to have been an error of telemetry: The TNC saw the wrong data or dropped a bit accidentally.

73, gerry

Making Tracks

One of the things we all learn when using APRS for a special service event is the importance of have a route map of the course, even if you did have a street level map you will still need a way to show the public the expected route.

I want to share with you the three general GPS ways to make a track map and another simple way that is often overlooked.

---

1. Beaming the data from a remote GPS tracker to a home APRS system and using the log/HST file to plot the route.

2. Raw NMEA GPS data direct to a portable computers disk file. This can generate LOTS of Data (Over one Meg. per Hour !)

3. TNC GPS track log data that is stored in a KPC-3 or others GPS TNC's. You will need extra RAM in the TNC as the default is about 17K

4. Garmin-40/45 or Eagle GPS built in track log file. All you need is the GPS, just set the data collection rate.

See the end of this report for samples of GPS/APRS data you can expect from each process and what equipment you will need.

Making tracks using only a GPS unit:

Tables A and B show the amount of data you can expect to collect at different sample rates for two type of GPS units.

You might get all the data you need using the automatic mode of a Garmin 40/45 but the data rate is variable and when the track log is full it starts erasing the oldest data points.

Once you have collected and dumped the GPS data into your PC a few quick touch ups with your text editor will produce a log file for use with APRS.

TABLE-A

Garmin 40/45 LOG Capabilities;

Sample Rate	Sec	Min	Hr	Day
1 per sec	768	12.8		
1 per 5 sec	3840	64	1.1	
1 per 10 sec	7680	128	2.1

<<bitmap maps... Once... we determine how useful it is>>

Mark -

Maps in image form are extremely useful; it's my opinion that the "stick maps" which are currently the standard in all of the APRS apps are make-do, and present poorly to non-hams such as found in public service events. The map quality problem is also a resistance point to another ham niche interest, foxhunting. I've been using MacAPRS for foxhunt plotting for several months now, and the first comment after "Wow!" when I show other hunters the display is always "Doesn't it have a better map?" In both cases I'd like to not have to apologize for the maps.

The development environment you're using for Mac and Windows (Code Warrior?) should easily have the means to support this. I now know what it takes to ResEdit the resource fork to get PICT maps to display, but the image and coordinate distortion problem vs. the window size makes the end result less than usable. Personally, I wish that y'all would finish the feature and let us get some real-world use out of it.

A suggestion - maybe you ought to abandon PICT and use GIF instead. It makes porting to Windows a little easier.

Also, PICT captures from StreetAtlasUSA aren't the only source of images. I've been pulling GIF images from the TIGER mapping website, which allows more control over features displayed and map size. I could mention scanning of printed maps, but, of course, the map copyright gods may smack me senseless, so I won't say anything. ;-)

IOW, bitmap maps are useful, available, and needed... and the next logical step for APRS!

665. New Map Editing Program...

From: jan@archimedes.vislab.navy.mil (Jan A. Barglowski)
Date: Thu, 25 Jan 1996 16:04:34 -0800
To: aprssig@tapr.org
Message-ID: <v01520d00ad2d5625dbeb@[129.131.31.10]>
Rendered body type: text/plain

Hi all!

I've put together a new APRS map editing program called MapEdit. Currently all it does is edit maps that have been previously created, however, it can manipulate everything on an APRS map. It is mouse-driven, with a full graphical user interface and a toolbar (like PhotoShop) for picking out the various editing tools. I plan on adding USGS DLG file reading, as well as support for the higher res MacAPRS/WinAPRS map format.

MapEdit was written in the scripting language Tcl/Tk (tickle). While Tcl/Tk has been ported to the Windows and Macintosh platforms, I have not run it on anything but UNIX workstations (SGI and SUN) and a PC running LINUX. So, to use MapEdit, you will probably need a Unix workstation with the Tcl/Tk interpreters installed. Sorry, but I have much faster computers to play with at work than at home :-)

If you are interested please visit my Web site at:
  http://www1.ridgecrest.ca.us/~jan/me/
The web site has some pictures and a better explanation of what you need to run MapEdit.

For those wanting to port APRS to a UNIX platform, you may want to take a look at this!

APRS has had pseudo differential built in for almost a year now. It is only turned on in the commercial version. It is the same as standard APRS, but at a fixed site you plug a GPS into your 2nd serial port. THen enter your KNOWN exact position. THen activate pseudo diferential correction. APRS will constantly monitor the local GPS and subtract the error from all incoming posits. In addition, it has a little vector display up by the cursor box that shows you the current error vector.

I have not announced this because:
1) I see no use for that kind of accurracy in amateur radio
2) The jury is still out as to whether it has any value, since theoretically it will only work if your GPS unit is using the SAME

```
satellites for the fix as the mobile is using...
3) It would just generate a lot of questions and nitpicking over accuracy
that no current maps can provide (unless you buidl them yourself from GPS
track historys
4) I promised PacComm that they could use it for 6 months before I
announced it in APRS.
5) I would want to charge more for it, hi hi. but get a lot of negative
criticicism about all my nickle-&-dime options already.

If someone wants to seriously beta test this capability, lemme know....
```

YOu left out plugging your GPS into your laptop
and letting APRS save a track history.

This gives you the sampling rate which is adjsutable in APRS without the
errors of lost packets transmitted over the air, and without the bother
of a radio and TNC...

The track history can be played directly into MAPFIX for drawing a map.
NO file conversions are needed.
```

> apologize for the maps.

The problem in APRS (or at least MacAPRS, which is all I know) is not
precomputed image maps vs. maps drawn on the fly from point data.  The problem
is that the current map data and the current map drawing software are very
limited and only produce simple, fixed format maps which are not suitable for
variable resolution viewing.  The current software is also slower than need be,
because it uses very simple drawing algorithms.

Maps drawn on the fly can be superior in detail and flexibility in what
features to present and how to present them.  Precomputed maps are superior
only when you already have a map generated exactly for your purpose and
location, and then it is superior only in speed of drawing and size of storage.

There is no real reason why drawn on the fly maps in APRS could not have solid
color filled areas, representing land, water, political boundries, parks,
forests, urban areas, mountains, or whatever.  Railroads could have little tick
marks, highways could have little signs, different boundries could have
different line styles, elevation could even be displayed as contour lines, each
type of feature could be switched on or off, the color for each type of feature
could be user selectable.  Different levels of detail can be present in the
same map so that zooming in shows more and zooming out simplifies the view.

It is not really necessary that all the data for the maps be loaded into memory
all the time, provided a more efficient storage structure existed on disk so
that it was fast to get the data you needed.  Professional cartography software
has been dealing with this sort of thing for decades.

Of course if there were a general extension mechanism where user supplied code
could be substituted for the built in APRS modules, then someone else might
```

write a really cool map generating extension that had all these features...

Chuck

It would be interesting to see a GGA sentence from all base stations.
Could this data be put into beacon text? If so mobiles could also add
this information when wanted. (My Magellan displays altitude but does
not send it out in the NMEA sentence. I would really enjoy being able
to use the 3D function with information from all stations!!! Is there
any other way an aprs station can post this info periodically ?

Correct - That is the number one solution and the first I tried
with both the MAC and PC version of APRS.

But I am now learning how to delegate

"Here, take this GPS unit and put it on your dash,
drive the route, turn it off and bring it back."

I might not get my portable computer back :-)

It is also a pain setting the portable computer
up in the car.

The formatting of my Making Track report E-mail got parsed
by the TAPR mailer. My forwarded copy to myself via
ONRAMP.NET mailer did not have the lines wraped or
the hex codes for the equal sign. If anyone wants a
a better copy send private e-mail.

>From "A GPS FAQ ver 5.0"

2.3 Why does the reported altitude vary so much?

Primarily due to satellite geometry. To get the most accurate
altitude, you should use satellites that are nearly overhead.
However, the satellites are more likely to be nearer the horizon,
and a receiver will likely choose satellites nearer the horizon in
the interests of getting a more accurate horizontal position,
since that is what most navigators are interested in. The error
in altitude is typically about 1.5 times the horizontal error.

The altitude may also _appear_ to vary more than the horizontal
position, since it is given in "normal units" (feet or metres).
Also, particularly for those of us at sea level, the real altitude

```
      is probably known better than the lat/long, making the error more
      obvious. (I know the altitude of my boat is 0 +/- tides. When the
      GPS shows an altitude of 200 ft (or -150 ft) I _know_ it is
      wrong!)

Rendered body type: text/plain

```
-- [ From: Peter Gross * EMC.Ver #2.3 ] --

Just stopped at the home qth for a good 8 hour sleep break and found the hf
antenna hanging. This time instead of the rope holding the ant breaking,
the wire itself broke. I won't have the time for a repair until I get back
home. Hopefully that'll be within a couple of weeks.

Sri for the undependability but that is the best I can do. If you haver any
comments you may forward them to JOe Lowey, KB4FO. He gets on the sig so
you may have his address in your database. I don't recall his address. I am
intouch with JOe several times a week.

Been on vhf continuously from the 18 wheeler except for when I forget to
turn it on. For some reason when I turn the trucks ignition off it glitches
the Zenith laptops power supply. Shortly there after the laptops power
light goes red indicating a low battery. I doubt the 4 - 180 amp hour truck
batteries are low  but there must be something that occurs when I turn the
switch off that makes the laptop think so. So  whenever I turn the truck
off, which isn't very often, I have to remember to first tend to the laptop,
, then of course remember to do it all over again when I start the truck. I
don't think the samething happens when I start the truck but I don't like
all those surges on the laptop so I make sure it is off before an engine
start. The engine is computer controlled, I hear several relays when I turn
on the ignition. No battery used on the laptop and it is wired direct to
the batteries. I really donm't get it!

Well I am having some difficulty deciding which to purchase first, an hf
rig, at abt $1500+ w/ant, or a digital tv system for abt $900! I am, at
least, ready to purchase one or the other very soon! Which do you think
I'll get more enjoyment out of? hi hi!

I believe the Atlanta area is beginning to be more populated on vhf Aprs
then anywhere else in the country now. We can thank, Ralph, N4NEQ, for his
hard work and much equipment for that. So the main areas are still, south
FL and area around the NY, CT, NJ, MD area as well as Atl.

I thank all the qso's and messages left in w7lus-11 while on the road
throughout the country. I hope someday there'll be alot more vhf Aprs all
over. I believe if Bob, WB4APR, would finish the device for mobile voice
repeaters that this would kick off an interest for every voice repeater
user. Hurry it up Bob, many of us are waiting, many of us unknowingly!

73 - Peter

680. Chance encounter- APRS simplex

From: rwf <rwf@mindspring.com>
Date: Fri, 26 Jan 1996 08:16:09 -0500
To: aprssig@tapr.org
Message-ID: <199601261316.IAA10025@borg.mindspring.com>
Rendered body type: text/plain

Reading W7LUS's message reminded me of my recent "Close Encounter of the
APRS Kind". I meant to relate it but had forgotten until now.

I've been on an extended road trip in Florida and will be for another month
or so.   I was in the sleepy town of Brooksville FL on Monday, Tuesday, and
Wednesday.

As i headed back towards I-75 for the trip South to Tampa, I was musing
about the lack of APRS coverage anywhere in GA South of Atlanta and all the
way to Tampa FL (about 480 miles).

All of a sudden the laptop beeped and I looked over at it. I was about to
run head-on into W7LUS-?. Well at least that is how it looked on my map.
His heading indicator was pointed NE and mine S and our speeds were high
enough to only allow me to send 1 message and get an ACK. I never saw a
message from him.

All the rest of the way down to Tampa I watched the stuff from Kevin in St
Pete and eventually was able to hit the Tampa Digi (pretty deaf).

It just goes to show you that you never know who you'll run into when
operating *VHF simplex* (no digi) mobile APRS.

Ralph N4NEQ

BTW if you see n4neq-9, msg me or email me here letting me know I at least
got thru a GATE somewhere. Gotta give ole' Bill something to watch on HF. ;-)
GATEing on 30 M is difficult down here right now due to the GATEFL 80 meter
experiment being done by Rich and Kevin. Thanks Kevin for leaving 30 M on
for a while tho-

1-square-mile areas individually. in all our search areas there are a lot of
old logging roads which often are quite close together. having the ability
to tell which of the three parallel roads 100 yards apart is being searched
is invaluable. vectoring a medical team to the subject is much easier when
we can tell them which road to use at each fork.

>2) The jury is still out as to whether it has any value, since

>satellites for the fix as the mobile is using...
>
        i would believe that having units in that close proximity with the
tree cover problems would cause them to primarily utilize the most nearly
overhead sattelites. in addition, we are sufficiently north (47) that our
coverage is more limited than other people.

>3) It would just generate a lot of questions and nitpicking over accuracy
>that no current maps can provide (unless you build them yourself from GPS
>track historys
>
        one of the prime things in a search is relative locations between
two units. having an automatic map plot of the locations is much more
convenient than doing it manually on a topo. it would be nice if we could
add (temporary?) lines to the map while running the program....

>5) I would want to charge more for it, hi hi. but get a lot of negative
>criticicism about all my nickle-&-dime options already.
>
        people are willing to pay for something of value. i have a number of
programs where the vendor wants to charge for upgrades which are only
bug-fixes. in these cases, i am running versions as much as 8 years old (and
4 full upgrades old). if they don't have a use for the option, they can sit
down and shut up. if the option is necessary then price is no option. most
things are in the middle and we have to decide if our desire matches the
price - but your 'prices' so far have been so cheap that only a professional
bitcher would quibble.

>If someone wants to seriously beta test this capability, lemme know....
>
        i wish i could be able to beat this up, but we can't afford enough
gps's. of course, we seem to be short a couple of weekends, too.....

Bob,

I know of at least three offices at ARINC that would love to beta test this
feature.  We have GPS labs in Dayton, Colorado Springs, and San Diego.  The
Colorado Springs lab has a GPS reference station and Dr. Wang at the San
Diego office is working on systems to provide differential error corrections
to within 2 centimeters for aircraft navigation and landing systems.

Anyone using the new GPS-31 TracPak, looks like a great way to build a
standalone tracker.

Tracks 8 satellites
NMEA 0183
RS-232
RTCM-104
10-30V
2.23"x3.8"x1.04"
Waterproof
$299

Bob,
I have been working with a local High School (Chaminade College
Prep/WA6BYE) over the last couple of years and have been wanting to do
exactly this in order to demonstrate the principles of GPS and DGPS.  We
have at our disposal two Eagle Accunav Sport GPS units and would be happy
to beta test this feature with the kids (I realize it is not TRUE
differential, but what the hey!).

Muchas Gracias--

Even easier than that is to capture the track on a GPS45, by itself, then
download the file using gardown (on tapr) and then convert it to aprs
format. There's a file to do this also on tapr called garmn45.bas. Works
great.....

Although I was an old pilot, and I had worked on equipment like DME, VOR, Glideslope, Transponder, Carousel INS, ACARS, and test equipment, I know practically nil about GPS. Since I am retired, these data are no longer available to me.

Where can get some rudimentary circuit description and block diagrams of the GPS and the Differential GPS? Perhaps someone in this forum can answer my few not-so-intelligent questions:

1. What microwave band are these satellites transmitting in?

2. What protocol do they use? Packet? Datagrams? ACARS? tcp/ip?

3. What data are contained in each datagram?

4. What improvement does the _Differential_ GPS have on its accuracy.

5. What is the accuracy with the D-GPS? As opposed to GPS.

6. How does the Pentagon "dither" the transmission. Is it continuous, fixed, or does it hop all over the place constantly? How much is the dithering? 10 meters? 20 meters? What intervals does the dithering take place?

7. What kind of clock do the satellites have? Cesium clock or Rubidium?

9. What is the accuracy of said clock?

Thanks in advance, and I will appreciate it very much if you would direct me to places and periodicals where I can see some circuit description and block diagrams. I have searched the county libraries online, but there is nothing on GPS.

Also... If anyone can direct me to places where I can find technical description on the following items, I'd appreciate it: Holographic laser reader of barcode, such as those at Supermarket. Magnetic resonance for detecting library books not checked out; or merchandise in department stores.

Thanks. 73

Rendered body type: text/plain

Keith Sproul noted (among other things):

>"YOU AIN'T SEEN NOTHIN' YET!"

That's good news, Keith. In your note and a separate conversation with Mark, it sounds like you're close to a new standard for vector maps that "blows the doors off" of what we're seeing now. Like I posted earlier, bitmaps are a compromise that are acceptable only when circumstances permit. I was on the bitmap bandwagon because it was the only information I had on what was to come.

So if we're close to getting the detail of bitmaps and the flexibility of vector, who am I to question progress? If the new vector standard can get here sooner than doing what it's going to take to fix bitmaps, then by all means do it!

Looking forward to what's next.

692. Re: Maps WINAPRS?

From: Mike Musick <71301.3106@compuserve.com>
Date: 26 Jan 96 14:27:34 EST
To: <aprssig@tapr.org>
Message-ID: <960126192734_71301.3106_FHJ69-1@CompuServe.COM>
Rendered body type: text/plain

```
As Chuck generally noted, in the comparison between pixel and vector expression
of an image, if the circumstances require variable scale, vector will win every
time. If the information density of the vector data can supply the detail
wanted at the desired resolution, then vector is the way to go. However, to get
substantive detail and delicate subtleties, the data requirements skyrocket, as
does the complexity of the system used to express the detail (and hence the
creation of complex systems like the vector-based Postscript).

I look at bitmap maps as a compromise - in trade for giving-up extreme
scalability, we gain expression of detail we can't reasonably ask of the
current vector-based system. And we also gain flexibility in information source
- scanners, the TIGER site I mentioned, screen captures from commercial mapping
products - all of which greatly improve the chance of getting the map we need
for a given situation. In all, the quickest means to an end - not the ultimate,
but still a fast way of getting what's needed.

But as seen in other responses, the bitmap discussion may become largely moot
in light of Keith's and Mark's progress in moving Mac/WinAPRS to a higher
density vector-based standard.

And Chris Brown asks:

>TIGER mapping site, who, what and most import WHERE?

It's at http://tiger.census.gov/, and because it's forms-based you'll probably
need Netscape to use it. You use a form to input the coordinates, size, and
features you want on the map, and it dynamically creates a GIF image. I haven't
tested the size limits of what it can create, but the images are very good and
comparable to scanning a topo map at screen resolution. The server is a little
slow, so it may take a minute or so to create a map with a lot of detail
layers, but the maps are excellent.

I have been manually adding the string /A=000600 to the beginning of the
comments line in IM for my station. This is the same format a GPS would
send out. I am at 600' elevation. It would be nice if wide digis also sent
real elevation, so you get a better idea of coverage.

/A=000090 is 90'   elev
/A=004587 is 4587' elev

Maybe Bob will add elev. in a future version. hint hint

Me too! using Zenith SuperSport 386/sx, and sometimes it goes 2 hours,
sometime 20 minutes and starts its low power shut-down. I put out a query
on Ham-Digital and tho I can not find the reply this minute, The basic
answer was = bad Zenith design, can not do it, reccommend using inverter
to AC brick to laptop! How's that for a kludge!

*****CORRECTION*****CORRECTION*****CORRECTION*****CORRECTION*****
SORRY, I HAD THE WRONG UTC. At least I'm only an hour slow.

Subj:   APRS net
Date:   01/25/96
To:     aprssig@tapr.org

As an experiment, and to stir up more interest in the Chicago area, the
DuPage Amateur Radio Club (W9DUP) will be taking check-ins on VHF aprs in
conjunction with our regular voice net on 145.25 MHz. The net will start at
0300 UTC (9:00 PM CST) sunday night 1/28/96.
PROCEDURE: Transmit name & QTH to W9DUP
                       When (and if) you get an ACK back, consider yourself
checked in.
HF and VHF station are encouraged to participate. So as to keep qrm to a
minimum, VHF stations should send only once or twice (you may not get an
ACK).
Show your support for aprs by checking in. I will post check-in totals and
calls next week.

Perhaps we just want to show off since Keith and Mark will be here for the
public beta release of WinAPRS. Perhaps we just want to see if a cross
country net could be done via APRS. Either way, it should be very
interesting. Hope to see you on the screen.

I don't know about South Texas, but the 1:100,000 CD-ROM available from
USGS for Southern California is generated from a 1979 database.  It's
rather disappointing not being able to see your street when you're living
in a house that's 15 years old in a tract that was non-existent back
then.

Rendered body type: text/plain

Does anybody have any information on the NEMA data that is sent from the Differential GPS (DGPS) receiver to the GPS unit that gives the correction information. I am interested in taking a GPS at a known location and calculating the error and transmitting that information to other GPS's out in the field. I understand that this is not an original idea but am very interested in any information that I may receive. Please send reply to "kc4hdk@gate.net".

thank you

704. PacCom's PicoPacket.

From: kc4hdk@gate.net
Date: Fri, 26 Jan 1996 18:58:39 -0500
To: aprssig@tapr.org
Cc: joseph@gate.net, kc4hdk@gate.net, n2czf@gate.net, johnj@gate.net
Message-ID: <199601262358.SAA18287@tequesta.gate.net>
Rendered body type: text/plain

I am interested to see if anybody that has the PicoPacket from PacCom has had any problem with the TNC resetting or destroying parameters when used in mobile operation. I have tried just about everything but when the power is removed from the unit it resets loosing all the parameters. It doesn't happen all at once sometimes it takes an hour and sometimes all night long but it has yet to operate for more than two days consecutively before I have to take the lap top out to the car and reprogram it. If you have had signs of this please E-mail me directly at "kc4hdk@gate.net" as I'm not on the aprssig directly.

Thank you,

Bob

705. 80M FL GATE (GATEFL) activity

From: n2czf@gate.net
Date: Fri, 26 Jan 1996 19:37:32 -0500
To: aprssig@tapr.org
Message-ID: <199601270037.TAA62246@osceola.gate.net>
Rendered body type: text/plain

Well Kevin and I have been runing the GATE on 80M for a couple of weeks now and it seems that we have a good idea of what is normal. At the begining we had several other stations on the air and it was interesting to see what can be done. Now that everything is settled and I was ready to take on the task of collecting data activity dropped off, I sometimes see 1 or 2 other stations in addition to Kevin no one else.

If everyone is still interested let me know or just get on the air. If you are not on HF but have a GATEFL in your area please be sure to add GATEFL to your UNPROTO path. This will increase the activity and let us all know that the path is working. APRS means to minimize transmissions so due to this we need stations for this test period. If only 1 or 2 stations are on the TX rate will be too low to really see what is going on, we need more than just the actual GATES to be on and making use of the network.

The frequency is 3.585.32 LSB with AEA tones...

Ok people let's see if we can figure this out... When I got home last night I
turned on my monitor and as usual I did a file save backup to have latest data
when APRS crashes. It no longer is IF but when it crashes... Well sure enough it
crashed soon after and I rebooted and loaded the backup file.

For some reason I zoomed out past FL and saw SEVERAL stations from Atlanta,
Georga, Alabama etc. most of these were WIDE stations and WERE NOT uplinks.
Since I saw this after I reloaded the file I had no data on the digi path but
here is what I had.

KD4LTR
WB8EYJ
KD4NCT

Hello Richard.
I was on 80m quite often last winter with nt2z and we played some with various baud rates. As may be expected the slower the rate the more reliable the link became. Swapped lies occaisionally with some lads in the Fla. panhandle, and elswhere East of the Mississippi. 3.585 lsb +/- a few, no sweat.

This Winter I have wished to do the same, but.... Those I hear appear scattered in frequency, and I see frequency numbers in SIG messages I cannot relate to. I see, in hf.txt, 2 AEA tones mentioned. My KAM is using the default 1600/1800 tone pair, but they can be changed at will. What to do, to get and keep keep everyone on the same rf frequency with the same shift?

I have heard both your and uyr's 80m cw beacon, and several others that slip the grey cells, but trying to catch the occaisional APRS beacon, tuned correctly, through the qrm, qrn, qsb, and scattered tx frqs, is a nightmare that has turned me off. I do not have enough life left to try and capture what's there.

If you can make some order out of mayhem, I will gladly add to the 80m qrm, at night when I do not have the precipitation? static that comes with the snow storms. (Tonight make me long for sunnier climes again!)

Pete, wa4hei

709. GPS45 Antenna problem and fix

From: w2g3zfj@unix.asb.com (bob)
Date: Sat, 27 Jan 1996 09:36:03 -0500
To: aprssig@tapr.org
Message-ID: <199601271443.JAA07758@UNiX.asb.com>
Rendered body type: text/plain

Hi folks,

My trusty GPS45 let me down on a trip to (flooded) Marietta, OH last week. When I got there found that I couldn't see any satellites and gave up after a while. When I got back, found the unit worked OK with the external antenna, so obviously a fault with the GPS45 antenna.

Managed to get the antenna apart easily, the white plastic is glued (not very substantially) to the black case. When its apart you can see that the antenna is a flexible pcb (looks like thin fibreglass, nothing exotic)wrapped into a cylinder about 10mm in diameter. Close examination of the joint between the centre pin of the BNC connector and the foil inside the cylinder (which was very difficult, needed Maglite and 20x lens) showed a hairline crack.

So, I took my hot iron and undid the seam holding the cylinder together and desoldered the BNC, couldn't unwrap it all the way as there is a circular aperture about half way. Anyway, managed to get to the offending joint and bridged it with a piece of thin wire. Reversed the procedure and tested it. Works fine!

Hope this helps someone

WB4APR REPLY COMMENT:

On such an invitation, and to minimize extra packets, it would be nice if
you published the specific digipeater callsign that is hit by your local
GATE.  That way, HF stations could tailor their path to go via GATE,XXXXX
and show up on your LAN instead of GATE,WIDE which hits every VHF network.
Just a thought...

Bob
Yes!!!!
i gave up and bought a KPC 3.
but i needed to have a tnc for the house any way and i have not gotten
to playing with the pico.
I talked to the people at paccom and my firm ware is very old
July 27 95 mine is pico sn 000034 so i have old firmware.
So this is what they told me i need new firmware they said they would
replace mine b/c it was so old.
when u power up ur tnc do it in a com program or o-c-t mode of aprs
and look at the date of ur firmware this may be ur problem.
hope this helps!

Had same problem here in flooded Marietta (GA). The GPS 45 flexible pcb
connection let go. Of course that was after i drove off with the GPS on the
car roof and it hit the pavement at 35 mph.

The antenna is not really that stout when it comes to abuse. Maybe that is
what Doug was talking about when he spoke of an "intermittent BNC connector"
that none of the rest of us have ever experienced.

Saw your post in the APRS SIG mail list.   I just got the Pico myself and am
having the same problem.  Was going to call them on Monday and inquire about
it.  I've been a Paccomm loyal customer for over 10 years now.  Built over a
dozen of their kit TNCs.  This is my first factory built unit.  Cute little
box.  I was also going to ask them about the pin out for the 2nd serial port
that isn't documented in the book.  The schematic wasn't a help.

Just thinking to myself as I read through today's mail here on the SIG.

One msg mentions about wanting better maps for foxhunts,etc. And another
about using .bmp and/or .gif
format maps. Putting these two complaints/ideas (whatever you want to call
them, that is not my purpose here) and throwing them in the blender and
mixing them up the resultant is  YES !, .bmp and .gif format map files would
be great, and here's one big reason why;

When you are providing support on the scene of a public service event  and
are presented with a route map for the run/walk/whatever, by being able to
take that map and scan it and save it as a .bmp or .gif file you could then
use it as a custom map for the event!

this could also work for emergency operations...example:

You are at the EOC and the EC has just consulted with his staff and they
have decided (on the spot) to use roads x,y, and z for northerly evac routes
and roads a,b, and c as Easterly evac routes to move civilians away from the
present disaster (NO WAY you could have this map ready before hand). They
hand you a map and you scan it in (could also be FAXed from remote site,
etc). After a simple cal routine (such as APR uses in mapfix.exe for the
digitizer) you can load the map and away you go!

Q: Anyone know what format the CIA database maps (micro world DataBank) are
in? These CD-Roms are cheap. How about AutoMap Roadatlas or AutoMap Streets
(from AutoMap now owned by MicroSoft).
```

That capability is avaiable right now if i'm not mistaken. A while back i posted
a program on tapr that will do a screen dump of your APRS screen into several
formats, you can then print them out. And as far as detailed maps they are now
easy to make. I have something like 250 or so just for Alabama
(May be many more) i lost count at 500 maps i have made that are all street
level maps that would work for waht you are talking about i would think. If
interested i can lookup the name of the file i'm talking about.

Hmmm, sounds a lot like what we've done here already. I wrote a quick and dirty
program that draws a .PCX file to the screen (say, of a scanned local-area map).
Then, just by using the mouse and the mouse-cursor, you click on starting and
ending points on the roads that you want. The points are then saved as pixel
points and are loadable as aprs map files. You don't need a digitizer pad,
because
you're actually defining which points you want ON THE SCREEN. You do have
to be careful and make sure you get the lat/lon, and range values correct.
It's a simple little program but could be very useful for small, local-area
maps. So far we haven't used the program (except for brief tests)...I just
wrote it to have in our APRS utilities package. I'm not too proud of the
.PCX loader routine...it's not that efficient, but it does work. I'd be
happy to upload it if folks are interested...
anybody that wants to improve on it would certainly be welcome to do so.

Fine, but custom made maps for public service events are seldom drawn to
scale (ie. accurately) This brings up the problem of GPS trackers. They
will plot *real* positions (within limits of GPS) which will not match
these maps. If every mobile uses the *same* maps, and also uses a
computer to *manually* input postion then this idea would work (but this
is not a very realistic solution)

There is a large map collection at the University of Texas at Austin. The
URL is as follows:

http://www.lib.utexas.edu/Libs/PCL/Map_collection/Map_collection.html

I downloaded a number of large scale maps from the CIA collection, which
has links from this page. The formats were both JPEG and GIF. I don't know
if these are the same formats as are on the CIA CD, but I suspect they are.
Anyway, they can be converted to whatever format works, using simple-to-use
Mac software. The ones I d/l'd were pretty, scanned images of North,
Central and South America. At the time of d/l, I was wondering if these
could somehow be put to use with APRS, so my interest in this thread is
very high. My primary concern is whether the maps have a usable projection
with APRS, or whether Mapfix.exe can "fix" them. I am fairly new to
APRSSIG, and not very knowledgeable with some of the language used by Hams,
so I can use some HELP! Please keep in touch.

Ok, now that Im on HF Id like to start to play with the gateway stuff.
We already have people on 30M ...is anyone on 17 meters or would
like to try on 17...Just send me a freq and I'll put it on and leave it
there!

I can operate (with my loop antenna-which so far is great !) between
10-30 mhz.

I'll try anything between those two freqs...

And make sure that your MYALIAS is set back to either echo or none on the
HF side, or it will needlessly digipeat all HF packets heard with GATE in
their Unproto path.

There seems to always be at least one station that has managed to leave
alias set to GATE, adding to an already congested frequency.

Thanks,

Mark

Rendered body type: text/plain

Hi Bob,

Yes, I have the same problem. It will keep parameters for a while, but after a short time, you power it up and it's lost everything. It's not just when I take it mobile...it happens in the shack, with 3 different power sources...makes no difference.

And...this is my second pico packet. The first one lost it's parameters EVERY time it was powered down and back up. I returned it and received another.

This is very dissapointing....it works fine as long as I don't power it down. I have not gotten around to contacting paccom about this one yet. Have you talked to paccom? I've got to phone them again soon about mine.

BTW im now running ver 3.2.9.2 dated Dec 10, 1995

733. Automatic DF Interface

From: Mike Musick <71301.3106@compuserve.com>
Date: 28 Jan 96 22:27:35 EST
To: <aprssig@tapr.org>
Message-ID: <960129032735_71301.3106_FHJ36-1@CompuServe.COM>
Rendered body type: text/plain

A discussion mostly directed at Bob, Keith and Mark -

I'm somewhat involved in two separate efforts to design and build a "new generation" automatic Doppler DF system. Both are microprocessor-based and have working prototypes; one I'll call "2nd generation" because it replaces most of the discrete logic with the uP but still relies on the analog audio process familiar in the Roanoke, the other is "3rd generation" since it's an all-DSP approach. One - if not both - plans to incorporate an electronic compass for instantaneous absolute bearings.

The obvious upshot of both is that there's a lot more horsepower available for intelligent output, so right now we're furrowing our collective brows trying to figure out how to feed APRS. The two standards supported, DSI and N7LUE, lose too much useful information and assume no processing intelligence in the RDF.

The following is information potentially available from these new devices:

  Relative Bearing (bearing in relation to mobile heading)
  Absolute Bearing
  Magnetic Compass Heading
  Quality of RDF Report (on the DSP version)

Information we would like to get *from* APRS is:

  Reporting Interval
  Local Angle of Declination
    and
  A command for bearing-on-demand.

Any thoughts? Preferences? Since this firmware is in the formative stages we'd

```
like to know what would make your job easier and still take advantage of all
the information that's there.

  -----

Also, a somewhat-related suggestion - it would be really nice if we could have
within APRS a lookup table where local angle of declination is automatically
computed from the coordinates. No, this can't be perfect, but it could
certainly goof-proof AofD computation for longer-distance mobiles.

Looking forward to y'all's sage wisdom!

734. Pico Problems ?

From: mark.endicott@nashville.com
Date: Sun, 28 Jan 96 21:29:45
To: aprssig@tapr.org
Message-ID: <199601290351.VAA28654@sys1.tapr.org>
Rendered body type: text/plain

```
I have been watching the sig for several months and not
          had a lot to contribute,  up to this point.  However a
          recent development has caused me concern and I think others
          may want to avoid the problem that I ran into.
               In August of 95 I ordered a Dual Port Pico directly
          from PacComm.  I was told that there were delays of about 2
          to 3 weeks on this unit.  I agreed and patiently waited, I
          called every two or three weeks until November when it
          finally shipped, three months later.   When I received the
          Pico I was surprised to find out that most of the features
          advertised were not coded into the eprom.  There was an
          errata sheet that explained what was missing and that I
          would get a free eprom upgrade when the code was completed.
          On December 15th I received a new eprom as promised
          (following my call to them) with the new software with most
          of the advertised functions operating.  I had been having a
          problem with the unit resetting to defaults for no
          explainable reason.  I called PacComm, in mid December to
          ask about this problem and was told that it must be a
          software glitch because they had not seen the problem
          elsewhere. I continued to look for the cause without any
          luck.  On January 11th, having the Pico "drop dead" 5 times
          that week, I called PacComm again.  This time they said that
          yes indeed they had a problem with Pico's and to send it
          back.  The Pico arrived at PacComm on Jan 15th.  Today, Jan
          24, I called Paul to find out what the repair status was. I
          was told quite rudely that "it was on the bottom of the
          pile" and "if I wanted it fixed I should pack my tool box
          and come to Florida and fix it myself" And that he (Paul)
          didn't need this kind of problem as he had been out of town
          and just returned to the plant.  I was then transfered to
          Linda to discuss my options.  She, who has always been very
          nice, agreed to credit my card and accept the Pico back, the
          "right thing to do".
               I have been in the electronic communications industry
          for over thirty years.  I started my company in 1984 and
          have seen it grow because we treat customers fairly and,
          most, certainly politely.  I understand that things go wrong
          from time to time, and that service can be a pain when
          engineering fails to perform as expected. However, PacComm
          should be more responsive to their customers and refrain
          from advertising and delivering a product far before it's
          ready to market.  If you are considering the Pico I would
          recommend that you investigate the product and the company
          carefully. The six months that I have wasted on PacComm and
          this project have been very frustrating.

Ralph, N4NEQ, sez:

Had same problem here in flooded Marietta (GA).  The GPS 45 flexible pcb
connection let go.  Of course that was after i drove off with the GPS on the
car roof and it hit the pavement at 35 mph.

     Ralph - I just checked the GPS 45 manual and it specifically says that
     you shouldn't use it on the car roof unless you tape it down first!!!

     (I did that to a camera a few years back - it was in the middle of the
     Mojave desert at Goldstone Tracking Station.  Got back to the motel
     abt 60 miles away, discovered that the camera was missing, and drove
     back the next morning to find in the dust.  Little mechanical parts
     don't fare well with shock and dust...)

     73 - Jon NW6H

Mike, it isn't your alias that needs to be changed to GATE, it is your
MYGATE that must be GATE.  Also, make sure the streamsw characters are
set at the factory standard of pipe "|" and tilde "~" for the dual port
kam operation.  And finally, maxusers must be >1 or you cannot use both
```

ports at the same time.

Hope this helps solve the problem, good luck.

738. PK-96 APRS Help

From: W4NBC@aol.com
Date: Mon, 29 Jan 1996 07:44:06 -0500
To: aprssig@tapr.org
Message-ID: <960129074404_209041177@emout06.mail.aol.com>
Rendered body type: text/plain

I have been trying to get my PK-96 to work with the 74C version of APRS. The
beacons go out but I am unable to receive anything. I just get garbage. I
have tried all parity options but still get "TNC NOT RESPONDING" or "I/O
Glitch Not Responding".
The PK-96 works just fine running JNOS or AX25. Any ideas would be
appreciated.

> (from AutoMap now owned by MicroSoft).
>

I already have the Micro World DataBank (MWDB) and that is the source of the
world maps in MacAPRS/WinAPRS..

I also have the CIA DCW (Digital Chart of the World) that is the source of
my NEW fancy maps.

I also have some other CDs on order and am working on TIGER data..

>How about AutoMap Roadatlas or AutoMap Streets

These people aren't about to give out their data formats.. Otherwise, I would
LOVE to do it.. (My brother, Mark, KB2ICI, talked to Delorme about this
exact thing about 4-5 years ago, they WOULDN'T BUDGE, unless you had
$500,000)

> 71301.3106@compuserve.com
> Operating MacAPRS 2.2.0 on a Powerbook 170 & PowerMac 8100
> Operating APRS 7.4f on an HP200LX palmtop

Wow, I can't resist saying, it all sounds just like the DFjr & DF PRO,
EXACTLY.
The PRO is our DSP version, Compass and all. And the jr. is still
Microprocessor driven. It almost sounds like you could be reading our specs,
but that's not possible yet.

To see the almost completed DF stuff go see
http://home.navisoft.com/agrelo/ae.htm,
but maybe you have been there already.

Because the format is SO COMPLICATED, it takes an entire extra program just
to decode the stuff and it is SLOW.  Also, the data is VERY verbose, we
take the data  and strip it down to what we need

We will be producing a CD-ROM of MacAPRS/WinAPRS maps that WILL be able to
do it all from our CD-ROM.

Mark

```
Maps and Bitmap images used for maps has been a topic of considerable
discussion.

I am going to address these two examples directly.

>When you are providing support on the scene of a public service event  and
>are presented with a route map for the run/walk/whatever, by being able to
>take that map and scan it and save it as a .bmp or .gif file you could then
>use it as a custom map for the event!
>

We (Keith and I) have been involved in bike-athons and other events as you
discribe.  99.99% of the time the maps supplied by these people ARE NOT TO
SCALE.  For SCANNING to work AT ALL, the maps MUST be EXACTLY to scale.
They need to be even in n/s e/w relations etc.  I have not seen any map
supplied by these types of events that would even be close to usable.

>
>You are at the EOC and the EC has just consulted with his staff and they
>have decided (on the spot) to use roads x,y, and z for northerly evac routes
>and roads a,b, and c as Easterly evac routes to move civilians away from the
>present disaster (NO WAY you could have this map ready before hand). They

We CAN have the maps beforehand.  Everyone is used to the DOS-APRS maps,
their limitations and their style.  Our MacAPRS maps have always been
dramaticaly more complex and detailed.

We have been making GREAT progress on maps.  PLEASE PLEASE drop the
conversations of MAPS for a few weeks until you have had a chance to see
our new maps for MacAPRS and WinAPRS.
```

After people have had a chance to see our new maps for THEIR area, then, bring up the discussions again.

We have made an announcement and I will repeat it again.

We will be producing a CD-ROM for Dayton that will be FULL of maps. Hi resolution map of all 50 states and Canada, street maps of ALL major cities. Street maps of areas of ALL APRS activity that we know of and as much more as we can fit.

For any one that has SPECAIL needs before then, and as long as we dont get over loaded with requests, we will make hi-res maps for people on a request basis. We need to know the city and state you want and we will make it. We will be making all of these anyway over the next few months.

For some samples, check out our web pages and the maps section

http://www-ns.rutgers.edu/~ksproul/APRS/

```

I was asked by the author of WinAPRS to please put up GOOD maps on my web page.

The best maps I have laying around are DOS maps.

Because the author doesn't seem to think the DOS maps are suitable, I'll take them off.

Sorry, guys!

Bob

I'm told that the DGPS info is the error satellite by satellite - and of
course
it's the satellites in view in roughly similar locations... I'd sure like to
know
if a simple single error applied will be good enuff.... I've also heard that
APRS has a error correction capability if your "base" station has a GPS
hooked up while the mobiles transmit their location....

Hope this helps..

AH6LS

Does anybody have any information on the NEMA data that is sent from the Differential GPS (DGPS) receiver to the GPS unit that gives the correction

information. I am interested in taking a GPS at a known location and
calculating the error and transmitting that information to other GPS's out
in
the field. I understand that this is not an original idea but am very
interested in any information that I may receive. Please send reply to
"kc4hdk@gate.net".

thank you

Bob

747. WinAPRS release Comments and review

From: Ed Rogers <edwardwr@inil.com>
Date: Mon, 29 Jan 1996 10:12:34 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <199601291612.KAA00244@sys1.tapr.org>
Rendered body type: text/plain

Hello,

As many of you know Mark KB2ICI and Keith WU2Z braved winter weather and the
congestion at ORD to travel here to Chicagoland this past weekend and
release the beta versions of WinAPRS.
We in NIAN wish to go on record and thank them for allowing us to be "first"
and to thank them for all the hard work that went into this program.
What follows is my first impressions of the program from someone who uses
both DOS and Mac versions, runs a standalone tracker on Land,Sea and Air and
has done some beta testing on software running the menu from Gov mainframe
stuff to AOL. Remember these are my comments only....

FIRST REMEMBER THIS IS A PROGRAM IN BETA STAGE ONLY, IT IS GOING TO HAVE
SOME BUGS AND MAY NOT YET HAVE ALL THE FEATURES IN PLACE, BE PATIENT AND IT
WILL COME....

Hardware used for my evaluations;

Quantex 486DX4 100, 16 meg ram, WD vid card 2meg vram, WIN95 OS, TNC TINY2
on COM4
Acer 486sx25 laptop, 4 meg ram, mono vga LCD, WIN95 OS, TNC KPC3 on COM1

Software WinAPRS beta 0.2.1, combo of DOS and MAC maps including some 30K +
data points

Comments

As a beta program this thing is fantastic!!! I have yet to make it crash,
even with my 4 meg ram laptop, if I open to many windows it just refuses to
go on unless I free up some memory but it doesnt dump the program! The
Quantex desktop has yet to slow down or stop loading any maps (after running
Mac APRS on 8 meg with ram doubler I was ready for difficultly with multi
windows and large maps).

The quality of maps on the program will astound DOS users it will display
MAC maps right out of the box, plus you do not have to worry about putting
new maps into a maplist file just stick them into the map folder (directory)
and you can use them. Also you mapmakers out there, make your maps using
data just as you did for DOS, but now you do not have to edit down the
number of points, just put them (any size) into the map folder and use them.

As you can tell Im impressed with this to date, it is not a replacement for
DOS APRS but rather an enhancement of the concept. DOS will continue to be
my program of choice for Mobile Ops because Im cheap and do not want to
expose my Windows laptop to the dangers involved in mobile computing, it
makes more sense to use a $100 640k 8088 for that <grin>.

CONS
Station Icons cover up map data, turn them off to enhance display (there
working on it)

Text on screen is hard to read, dont know if its font or display related.

No DOCs and many features not yet implemented (its Beta remember)...

all for now
73

One NMEA specification (MMEA-0183 is what I am using) defines the data
stream FROM the GPS receiver to peripheral equipment (printers, computers,
displays, etc.).  The link from a differential correction receiver TO the
GPS receiver is defined by a specification known as "RTCM-104".  I do not
know who put's this out, but I know it is working for me between products of
different vendors.  I think I saw something on this in the Coast Guard's web
page...

I use a PK-96 all the time for both Mac and PC APRS base station.
Most items are default. I don't have the lastest GPS firmware
that is now available for the PK-96

Try a regular comm program to test, the computer baud rate might
be incorrect. Try the default 9600 baud , 8 bits, no parity, one stop bit.
(the old 8,none and 1)

You might try a full reset to factory settings or use 4800 baud if
you have a older PC.

If all else fails send me, by private e-mail, your display settings and
I will look them over.

Oh, yes.  The errata sheet.  Was I surprised to find out a few things about
my Pico on that piece of paper.  Like no DCD (open squelch) or KISS mode.
```

```
I never saw these features advertised, but I just figurerd they'd be part
of a modern TNC...

>           ...  I was then transfered to

>           "right thing to do".

When I called PacComm (don't know who I talked to) to discuss the Pico,
the *first* thing the lady asked was "Do you wish to return it?"

>           ... If you are considering the Pico I would
>           recommend that you investigate the product and the company
>           carefully. The six months that I have wasted on PacComm and
>           this project have been very frustrating.
>

I've had great luck with a Tiny-2 and a Sprint-2 from PacComm.  But I had
nothing but trouble from my Pico.  I could not get it to power up from
6VDC (advertised to run on 6VDC!), or 9VDC, but only off my 13.8 VDC
power supply! (There goes the portability :-)  I don't know whether it
had some serious problems or just a old EPROM.  You should have seen the
look on my face when I opened the unit and saw "PRE-RELEASE" on the EPROM!
I get the feeling that the product wasn't ready to go out the door, and
hence, I returned it.  I'll get a KPC-3 instead...

Cool.  Glad it worked.  I've been to that coast guard site, but havn't done
much reading other than to check on the status of the local beacon
transmitter.  I'll have to look it over more carefully.

Cheers.

Jim

756. WinAPRS Beta mailing list

From: sproul@ap.org (Mark Sproul)
Date: Mon, 29 Jan 1996 15:57:09 -0500
To: aprssig@tapr.org
Message-ID: <v02130502ad32e3c1dd9c@[165.1.27.20]>
Rendered body type: text/plain

```
TAPR now has a NEW mailing list.. The new list is  winaprs@tapr.org

To subscribe to this list send mail to

        listproc@tapr.org

with the following in the body of the message

        subscribe  winaprs  <your name>
```

This list is for the DISCUSSION of the WinAPRS beta.. It is NOT for discussion of general APRS topics. Lets keep them on the APRSSIG!

The people that SHOULD subscribe to this list are those actively using WinAPRS.

We recommend that only those people activily using WinAPRS beta subscribe to this list.

The types of things this list is designed for is issues pertaining to the development of WinAPRS. It is more for the discussion of what needs to be done in the program, priorities, bugs, incompatibilities, etc.

This was suggested by some of the people in Illinois as a mechanism to allow those involved to know what is going on, and so that we don't get deluged with hundreds of reports of the same little problem, etc.

Mark Sproul

Humm, something wrong here. Running Packard Bell 75mhz Pentium with a PK-900
and nothing much happened here with WINAPRS. Screen came up but most
function's disabled. Trying to open VHF TNC and keep getting msg cant open
port. All selection's for TNC and station info and such are all "ghosted"
out. Tried to start WINAPRS in host mode and other's and have done a hard
re-set, and still same thing, nothing. Went through CFG file and filled in
what I could.
Gonna keep trying but wont hold my breath.

Can any one help?  I have an Eagle Accunav sport and a KPC3/ver6. I am also
using a AEA switch on the rs232 connecter.  Every time I connect this
connecter it sees that I can't change my unpronto and it always comes back
with c"current Digipeter is (blank) and I can't change it. If I disconnect
this connector APRS work OK.

I don't even know if I have set the software up correctly to accept GPS.

I would appreciate it if there is any one out there who can help in layman
tearms (not to technical).

I beleave the only thing I had to do to the Eagle was to make sure it was on
NMEA was 0183/starlink with no beacon set up. Again if this is wrong, please
help.

Tom

If your communications software allows it, use ZMODEM to download files.
Not only is it a fast, reliable protocol, but if you get dumped in the
middle, it will *re-start from the middle* when you re-connect. It won't
re-start automatically ... you have to tell it to download the file just
as you did originally, but it checks your download directory for the file
and will see that it is already partially there, and will then start at
the proper spot to complete the download.

So instead of two tries with 1 meg unsuccessful results, you would have
now have a file 2 meg long (or a complete file...I don't know how big it
is) that may be finished on the third try.

It seems that I owe Mark and a few others an apology.  In what he meant to
be a good-natured hint, I took as a flame, and I took it public to the SIG.
My apologies to all.

And if you have web access, please check into
http://tbcnet.com/~jleonard/n9vjq.htm
to see the screen shots of DOS maps on APRS, DOS maps as they appear on
WinAPRS (great!), and the maps that Mark and Keith Sproul made for inclusion
with WinAPRS.

What I wanted to show was how easily maps made by the MAPFIX program were
used by the WinAPRS program, and how nice they looked.

As hopefully we'll all now find out, maps can be used from one end of the
APRS computer spectrum to the other.

Thanks to Bob, Keith, and Mark.  They all deserve a lot of praise.

Date: Mon, 29 Jan 1996 20:48:25 -0500
To: aprssig@tapr.org
Message-ID: <960129204624_306903950@mail06.mail.aol.com>
Rendered body type: text/plain

Hi Earl;

I have a similar problem if I try to run my PK-96 at 19200
baud when talking to the computer. I use it at that speed
when running WISP and talking to the 9600 baud birds
but APRS doesn't like it that fast. So I set it to 9600
baud when using it with APRS. Also make sure expert mode
is turned on. Also if you are using the packratt software,
make sure you uncheck the host mode on exit. I have used
mine also for working Meteor Scatter with APRS and it works
just fine. Also be sure to select AEA when starting up from
the begining menu.

Good Luck   Gene, N9GJJ

If there's a preference I'll take this off-line.

AlChan@aol.com sez:
>
> Where can get some rudimentary circuit description and block diagrams of the
> GPS and the Differential GPS? Perhaps someone in this forum can answer my
> few not-so-intelligent questions:

http://www.zilker.net/~hal/geoscience/gps.html

Hal Mueller's page is a great place to start.

> 1. What microwave band are these satellites transmitting in?

L band, with the L1 signal (Coarse Acquisition) at 1542.75 MHz, and the L2
signal centered at 1275 MHz.

> 2. What protocol do they use? Packet? Datagrams? ACARS? tcp/ip?

GPS words based on DoD ICD-GPS-200. It's a series of 30 bit words with 24 data bits and 6 parity bits. The data rate is 50 bps.

> 3. What data are contained in each datagram?

Timing information, primarily, although Satellite Broadcast messages are interspersed, as well as a periodic Almanac, Health, and Ephemeris data. Ephemeris data are transmitted by each satellite ONLY for that satellite.

> 4. What improvement does the _Differential_ GPS have on its accuracy.

Approximately one order of magnitude. If you have an anticpated error of 100 meters without differential correction, you cn safely anticipate an error ellipse of _about_ 10 meters with differential correction. Depending on the differential technique.

> 5. What is the accuracy with the D-GPS? As opposed to GPS.

L1-C/A code (the fancy way to say, "civilian") can expect 15-45 meter ellispes of error with Selective Availability turned off, and 30-100 meter errors with SA on. SA is a method the DoD uses to degrade performance intentionally so as to prevent enemies from using GPS for precise positioning for military purposes. Differential correction can effect a single order of magnitude improvement in positioning error, or, 1.5-4.5 meters with SA off, and 3.0-10 meters with SA on. The SA-off numbers assume *everything* is working perfectly.

the intrinsic error of GPS will actually limit precision to about 10 meters in most cases due to common mode errors. Some of these errors can be countered in post-processed differential correction using precise positions for the various Space Vehicles, known as precise ephemeris, as well as applying conventional differential positioning data after the fact.

> 6. How does the Pentagon "dither" the transmission. Is it continuous, fixed, or does it hop all over the place constantly? How much is the dithering? 10 meters? 20 meters? What intervals does the dithering take place?

"Dithering" is known officially as selective availability. The DoD applies errors in the messages broadcast by the satellites to the C/A users that effectively lie about both satellite ephemeris (thereby giving a wrong satellite position by some number of meters) and timing (effecting a mistaken solution for range to the satellite). The dithering is pseudorandon, and the result of a classified and extensive algorithm. To the best of my knowledge, it has not been cracked. It usually causes the apparent position of a fixed station to "wander" in the pattern of a drunkard's walk, with occasional jumps in apparent position that cannot be accounted for by common mode error or selection of a different satellite for position solution. Over the period of a day (24.0 hours) the net error of an appropriately averaged position should be zero based solely on error induced by SA.

> 7. What kind of clock do the satellites have? Cesium clock or Rubidium?

Yes. The Block 2 satellites use a Cesium standard that is time-corrected daily by the 4 locked standards operated by DoD.

> 9. What is the accuracy of said clock?

Good question. I do not recall the exact number but it must be better than a nanosecond.

There is a pseudo-NMEA set of messages that has been defined.  Otherwise, the
corrections are sent at RTCM SC-104 format (currently Version 2.1).

RTCM == Ratio technical Commission for Maritime Operations
SC-104 == Special Committee 104 (GPS Corrections data)

> just curious

More than likely, a combination of _3_ things:

1.  SA-induced wandering.
2.  System common mode errors you cannot reasonably hope to fix (imprecision
in things like the receiver's clock and the transmitted ephemeris vice the
satellite's actual position
3.  Imperfect geometry due to the building blockage.

> know
> if a simple single error applied will be good enuff.... I've also heard that

Correct on one part:  It is SV by SV generated.  Assume you have a base at a
well-surveyed point, with precise coordinates.  That site receives all
satellites in view.  It calculates a pseudorange based on ephemeris data
supplied by each satellite.  It acquires pseudorange data from each message
from the bird.  The correction for pseudorange is the difference for EACH
satellite.  Similar things are done for the rate of pseudorange change.
```

```
A single correction applied by the receiver to each Satellite's data would
give real error... or garbage.

73, gerry

        You can get win32s from
http://cwsapps.texas.net/plugin.html#openscape

One thing I haven't seen discussed yet is Winaprs doesn't have the serial
port stuff working yet under windows 3.1, 3.11. It will only work with
your TNC under 95 or NT.

```
____MESSAGE HEADER INFORMATION DO NOT WRITE ABOVE THIS LINE______
```

I wrote this file with the intent to post it as a bulletin in my pbbs. I wanted to provide new users with a concise guide to the basics of using APRS'S generic callsigns. My desire is to decrease the use of inappropriate outgoing paths. My hope is that most hams will want to use the correct technique if they are given an opportunity and an explanation of the reason.

Any comments or suggestions are welcome. I would especially like to hear from Bob Bruniga if he feels that anything needs clarification or improvement.

I limited myself to keeping the file under 4k so that it would fit in most tnc mailboxes and could be read with minimal disruption.

Comments or suggestions can be sent to me via the sig if of interest to all or to these address for personal replies.

<JKHAM@DELPHI.COM> OR <KC4ZGQ@AOL.COM>

-------------------------SNIP--

Hello and welcome to the KC4ZGQ WIDE-RELAY digipeater located in MACON GA. I prepared this file to offer new users of APRS some hints on how to set some of the parameters used in APRS. These are not my suggestions alone they are derived from the documentation provided with the aprs program and the on going discussions on the <APRSSIG@TAPR.ORG> on the INTERNET. These tips are designed to allow the new user to get the most range with the least QRM to the frequency.

First a brief explanation of APRS and how it works. APRS is an UNCONNECTED packet protocol. This means that it uses the, <UI> {unconnected information frames} that your tnc sends to the address you specify in the UNPROTO command in your tnc. APRS has many uses in real time position and weather reporting. APRS uses several generic callsigns to allow mobiles to report their position without having to set a new outgoing path in their UNPROTO command. Many mobiles consist of a TNC,RADIO, and GPS {GLOBAL POSITIONING SYSTEM} receiver. Without a computer attached changing TNC commands is difficult. These generic callsigns should not be used for normal APRS operations. These generic callsigns are listed below with an explanation of their normal usage.

1: The <WIDE> alias is used as a link between widely separated areas. If there are more than two digis with the alias of <WIDE> in a given area they will digi in a circle and generate numerous unnecessary packets. So please don't set your MYALIAS or MYNODE callsign to <WIDE> without asking an experienced APRS operator if it is appropriate.

2: The <GATE> alias is used to allow mobiles on HF to report their location through a <GATE> station and into local VHF networks. GATE should almost never appear in a VHF stations outgoing path. The reason for this is that the VHF networks are operating at 1200 baud while HF is only running at 300 baud. It only takes a few VHF beacons to totally saturate the HF network NATIONWIDE. This will not make you very popular. On occasion special events may be gated VHF>HF but this is only done with prior planning. So please don't set your UNPROTO to <APRS VIA GATE>.

3: The <RELAY> alias is used to allow low power mobiles that are in range of any APRS station to digi into the net through an APRS home operators station. It is ok to set your tnc myalias to <RELAY>. However you should not set your UNPROTO to <APRS VIA RELAY...> for a home APRS station. This path is ok for low power mobiles.

Now you no doubt are asking what should I use in order to be seen both locally and in other parts of the state. My suggestion as a place to start is to set the following in your tnc.

```
MYCALL  = CALLSIGN
MYALIAS = RELAY
MYNODE  = CALLSIGN -SSID   OR LEAVE IT BLANK
UNPROTO = APRS VIA KC4ZGQ,WIDE
```

I used my own callsign in the above example you should use the callsign of the wide area digi that you hear the best. The extra wide will cause your packet to be repeated by the next wide area digi beyond the first callsign. The alias of relay in your myalias will allow a low power mobile to digi through you to the network. APRS gives you the option to change your UNPROTO ADDRESS as often as you wish. You can set up to 12 out going paths using the OPS-DIGI COMMAND from within APRS.

I prepared this file to offer help to new users of APRS. I am not
trying to dictate my way or demand that people follow the "rules".
I only hope that these suggestions will get new users up and running
with a minimum of problems. I can be contacted at the following
addresses on the internet.

JKHAM@DELPHI.COM

KC4ZGQ@AOL.COM

OR VIA THE KR4OL BBS IN MACON.

Will Bill your not the only one that's for sure. Yes WinAPRS is just a Playtoy
in windows 3.1 or Windows for workgroups, and if i might say not a very good
toy at that hi. I have run it today and these are my observations (Only mine!).
I find it extremely hard to look at those maps. Some maps come up on the
screen then instantly disapear. In this version there's not much to play with
and realy doesn't give you a true picture i guess of what it will be like. I also
noticed when loading the logging file the bar on the bottom part of the screen
doesn't show much more then a flikker (A single line). Well i guess unless you
are willing to run Win95 (And i'm not) we will have to wait and see about
WinAPRS. Right now i will stick with my Windows for Workgroups and Bob's
good old Dos APRS (I like the maps much better)...

rwf,
        Sorry - I should know your name but it wasn't on your message.

        I really don't think it is a "leak" to pass along the APRS
concerns to the coordinators' remailer.  I think that you (collectively)
have raised serious concerns which must be addressed.  I am the repeater
coordinator for Wisconsin (and new at that).  _I_ have been forwarding
selected messages to the coordinators' remailer to let them know of the
rapidly growing use of APRS and what YOUR needs are.  I know that there
are several other coordinators on the APRS remailer as I recognise their
addresses.
        Personally I think APRS is a good idea - if I didn't I wouldn't
spend about an hour a day posting APRS messages on Omnifest.  _I_ think
that if APRS does NOT get some help form the nation's coordinators the
confusion factor will raise and the "turf" (read spectrum) wars will
accelerate.  I am only one of approximately 100 coordinators and MY
coordination group ONLY SUGGGESTS coordination for repeaters.  There
IS a move afoot that MAY lead to mandatory coordination.

Dave Barrow, N9UNR

```

```
>To: The Brothers Sproul: Will WinAPRS run under Windows NT?
>

Absolutly,

Note to all, (this is explained in the read me file)

WinAPRS is a Win32 application, this means its desgined for Windows95 and
WindowsNT.  It will ALSO RUN in Windows 3.1 IF you install Win32S DLL from
Microsoft.  My documentation has info on were to get Win32S and pointers on
documentation on how to install it.

CURRENTLY, WinAPRS does NOT, I repeat DOES NOT do serial I/O under Windows
3.1 even with the Win32S DLL.  Without Win32S it will NOT RUN AT ALL.

I am working my tail off on the Windows 3.1 serial issue.  It WILL be fixed
soon, hopefully a couple of weeks but I am not making any promises.  Its
difficult.
```

```
So, please, if you are running Windows 3.1, and you cant get the serial
ports to work, its documented that they currently DONT work.

Mark

Bob

Isn't this saved in the config file?  If it isn't, just save it there.  Then
folks can configure it as they wish.  As a matter of fact, it would be great
if the config file saved all option selections.

To all people interested in WinAPRS

I am sending this message to many individuals, the APRS sig, and the new
WinAPRS mailing list so you might see it several times, I appoligize.

As was announced yesterday, we have created a new mailing list,

        winaprs@tapr.org

All discussion of WinAPRS should be moved to this mailing list, over 70
people have already signed up.  From now on, only major annoucments
reguarding WinAPRS will be made to the general sig.

Also, there is a new FTP site for APRS

ftp://aprs.rutgers.edu/pub/hamradio/aprs/

This is on a high-end unix machine with a LARGE number of allowed
connections, it should NOT have the problems of TAPR.

This is now the OFFICAL ftp site for MacAPRS and WinAPRS

Again, I appoligize if you recieve multiple copies of this

Mark Sproul

>From the documentation (http://www-ns.rutgers.edu/~ksproul/APRS/)

 System Requirements for Windows

WinAPRS is written to the Win32 API, which means that it works under
WindowsNT and Windows95. To run
under Windows 3.1, you will need the Win32S library (DLL). It has been
tested (not extensively) under Windows
3.1 with Win32S.

WinAPRS has been tested on a 386 running Windows95 and while slow, worked
just fine. A 486 of at least 33MHz
and 8 meg of Ram running either Windows95 or WindowsNT is recommended.

Comm Ports 1 thru 4 have been tested and all work fine (Version 0.1.1).

All of my initial testing was on a 486/66 running Windows NT. As of Jan 1,
1996 I am running on a Pentium/100
running Windows95. (Comment about Windows 95, WinAPRS on the 486 running
WindowsNT seems FASTER
than on the Pentium running Win95).

The following information can be helpful with Win32s:

       Win32s for the Microsoft Windows 3.1x Operating System
       http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/win32s.htm
       Installing Win32s
       http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/Draft/WM063.htm

Excellent - I would only add some known good digipaths that extend out from
your area into other areas if they exist. New or transient users would then
know how to set their unproto if they want to propagate their packets towards
a specific location.

Jack

797. Maps Again

Bob and others interested. The newest MK100V20.exe is pretty much useless.
Today i attempted to make a grid of maps using the 9 grid feature and it
crashed on the first +1 mile map i did, yet when renaming the TEMP file and
using Mapfix18.exe it only showed it had 1843 points. The program idea is
great but not if it doesn't work. I just wonder if anyone else has used this new
version with more success then i have?. Also Bob Mapfix18 seams to be limited
to what size file it will load. I attempted to load a temp file after the software
choked on making the map and Mapfix18 also did. The file was 110K.

rwf,
        Sorry - I should know your name but it wasn't on your message.

I really don't think it is a "leak" to pass along the APRS concerns to the coordinators' remailer. I think that you (collectively) have raised serious concerns which must be addressed. I am the repeater coordinator for Wisconsin (and new at that). _I_ have been forwarding selected messages to the coordinators' remailer to let them know of the rapidly growing use of APRS and what YOUR needs are. I know that there are several other coordinators on the APRS remailer as I recognise their addresses.

Personally I think APRS is a good idea - if I didn't I wouldn't spend about an hour a day posting APRS messages on Omnifest. _I_ think that if APRS does NOT get some help form the nation's coordinators the confusion factor will raise and the "turf" (read spectrum) wars will accelerate. I am only one of approximately 100 coordinators and MY coordination group ONLY SUGGGESTS coordination for repeaters. There IS a move afoot that MAY lead to mandatory coordination.

> coordinates and altitude. How often do they have to broadcast such
> positional data as they whiz across the sky? What is the orbital
> speed? How often are their position updated? I supposed NASA is in
> charge of periodical positional updating. Where is the location at
> which such updating is done? Mountain View, California?

The satellites do not compute their coordinates. Instead, they send the ephemeris data and the receiver, which is really a pretty powerful microprocessor, calculates just where the satellites should be based on the time now, one epoch ago (a slippery term... may be one second, may be more or less), and where it'll be one epoch in the future. It takes approximately 21 minutes, if memory serves me this afternoon, to complete one whole message. Every data transmission has timing information (spread spectrum, with each satellite using a set pseudorandom sequence that the receivers all know for hopping). Once the integer ambiguity of the timing signal phase has been resolved, the GPS receiver has a good lock to GPS time and can stop using its internal clock for anything beyond rough timekeeping.

DoD and National Space Command are responsible for the epherides the satellties carry. In fact, NASA gets ITS tracked data from NSC and refines them experimentally, and based on data they derive from their (now somewhat limited) tracking network. Oh, and the Big Blue Cube has been deactivated in one of the Congressional budget cuts. NSC is homed at Colorado Springs now.

WB4APR REPLY COMMENT:

Not sure of what he is referring to, but APRS can still be used as a
location identifier with ambiguity.  Using a 4 digit grid square in any
BEACON ID would plot you within about 50 miles, and using a 6 digit grid
square would locate you within about 5 miles.  In either case, APRS does
not mark the spot, but simply draws a box around the grid square and
places the callsign in the box randomly.  This plotting technique was
designed specifically to maintain the position ambiguity no matter how
close the user zooms.

John:

General setup information is in the WX.TXT file in APRS\README directory.  I
just set up my U-II interface yesterday, so I'm happy to answer any specific
questions you might have.  Of course, you will need two COM ports (one for TNC,
other for U-II) and the WX registration number from WB4APR.  Also, an adapter
cable to go from the "RJ-11" jack on the side of the U-II display to your RS-232
port (easy to make, or you can buy from Peet Bros for $20).

Good luck

806. RESPONCES ABOUT PICO PACKET

From: kc4hdk.gate.net@gate.net
Date: Tue, 30 Jan 1996 20:15:43 -0500
To: aprssig@tapr.org
Cc: kc4hdk@gate.net
Message-ID: <199601310115.UAA27208@tequesta.gate.net>
Rendered body type: text/plain

Bob,
        I have the 2 port pico paket and have had the same problems with
retention of my setting's; very frustrating when one want's to operate a
standalone tracker. The way I get around this is by using a nicad battery
pack into the main power jack. I suspect the lithium button battery inside
the tnc isn't adequate.
        When left indoors my setting are retained almost all the time. If
left out in the car at 40^ or less, retention is only about an hour at best.
        Some of the other problems I have include garbage text when I use
the help command, total lockup of the unit when put into kiss mode, and high
RF leakage from the unit.
        I called paccom and was advised they would be sending me a new
eprom; but all I got was a catalog. I'll have to call again! I think their
ability to keep track of phone message's is somewhat lacking

                 David E. Barrett
       barrettd@crpl.cedar-rapids.lib.ia.us

Bob, saw your post and am having exactly the same problem, Am running
my PicoPacket mobile and if I turn it off it will often reset to the
factory default parameters. I have taken to going to O-C-T every time
I boot APRS since there is about a 80% chance I have to reconfig the
parmaters. I have also taken to leaving it on but am very nervous re:
the surges with turning the ignition off and on. Annoying problem! let
me know if you find a fix! Thanks,

Joe, AA8SF
jbc5@po.cwru.edu

From: John Kerr <john.kerr@marvin.projectx.com>
Hi Bob..

Just read your message about the PicoPacket resetting/destroying the configuration data held with it. I have been running the Tiny II with internal GPS in the vehicle since Dayton last year, and I have experienced EXACTLY what you have mentioned. I can go for weeks with-out a problem, then one day I go out, turn on the transceiver and find it is not keying.. I leave the TNC turned on all the time (not concerned about it drawing down the vehicle battery), so I don't know if it is seeing a spike from the ignition when I start the vehicle, or if it is just going brain-dead.

I have considered putting a large filter capacitor across the DC input to maybe smooth out any incoming spikes, but have to wait for winter to finish first...

Let me know if you find out anything....

John - VE3SVE - located just outside Toronto, Ontario

From: Scott Miller <scottm@sierra.net>

HI Bob, Scott here in Tahoe City Ca. I have a PICO PACKET. have not yet used it as stand-alone but I will be in the next couple of days.
With the computer attched if I turn it off I lose lpath and loc most of the time. I got my pico befor 74e and Bob wapr sez it is designed as a stand-alone but that is not what I intened to buy, I picked it up at PacComm in Tampa myself. I have to use it in master mode to see myself on the map. I am looking forward to seeing Gwen's reply.And I do think he will reply
Scott ke6rke

From: msproul@arn.net (ML Sproul)

A friend of mine had the same problem. He sent it back for repair and it had the same problem when it was returned, He found that it would also reset to defaults when it was cold. He could put it in his refrigerator (not freezer) and it would reset. It wopuld do this consistently. Hope this is some additional info for you.

To: Bob <kc4hdk@gate.net>
Subject: PicoPacket
Message-ID: <960128151902_73251.32_FHO55-1@CompuServe.COM>

I have had the exact same experience using the PicoPacket. When power was removed (overnight), it would reset to factory defaults. This is a real pain in my GPS tracker application because the GPS' NMEA output is at 4800 baud!

For this reason, I decided to change to a KPC-3 for my GPS tracker. I have had nothing but good luck with Kantronics equipment.

The PicoPacket had to be returned once because it would only transmit. It would not receive anything. I even went through all the trouble of testing it with an oscilloscope as per the book, then calling tech support. They said it was bad and that I should send it back...very frustrating.

Good luck. If your lucky you can change the battery in the PicoPacket and be in business.

From: n4nr@vulcan.com (N4NR)
Hi Bob,

Yes, I have the same problem. It will keep parameters for a while, but after a short time, you power it up and it's lost everything. It's not just when I take it mobile...it happens in the shack, with 3 different power sources...makes no difference.

And...this is my second pico packet. The first one lost it's parameters EVERY time it was powered down and back up. I returned it and received another.

This is very dissapointing....it works fine as long as I don't power it down. I have not gotten around to contacting paccom about this one yet. Have you talked to paccom? I've got to phone them again soon about mine.

BTW im now running ver 3.2.9.2 dated Dec 10, 1995

Subject: [APRSSIG:6335] Re: PacCom's PicoPacket.

Saw your post in the APRS SIG mail list. I just got the Pico myself and am having the same problem. Was going to call them on Monday and inquire about it. I've been a Paccomm loyal customer for over 10 years now. Built over a dozen of their kit TNCs. This is my first factory built unit. Cute little box. I was also going to ask them about the pin out for the 2nd serial port that isn't documented in the book. The schematic wasn't a help.

Oh, yes. The errata sheet. Was I surprised to find out a few things about my Pico on that piece of paper. Like no DCD (open squelch) or KISS mode. I never saw these features advertised, but I just figurerd they'd be part of a modern TNC...

> ... I was then transfered to
> Linda to discuss my options. She, who has always been very

When I called PacComm (don't know who I talked to) to discuss the Pico, the *first* thing the lady asked was "Do you wish to return it?"

> ... If you are considering the Pico I would
> recommend that you investigate the product and the company
> carefully. The six months that I have wasted on PacComm and
> this project have been very frustrating.
>

I've had great luck with a Tiny-2 and a Sprint-2 from PacComm. But I had nothing but trouble from my Pico. I could not get it to power up from 6VDC (advertised to run on 6VDC!), or 9VDC, but only off my 13.8 VDC power supply! (There goes the portability :-) I don't know whether it had some serious problems or just a old EPROM. You should have seen the look on my face when I opened the unit and saw "PRE-RELEASE" on the EPROM! I get the feeling that the product wasn't ready to go out the door, and hence, I returned it. I'll get a KPC-3 instead...

Subject: [APRSSIG:6352] Pico Problems ?

I have been watching the sig for several months and not had a lot to contribute, up to this point. However a recent development has caused me concern and I think others may want to avoid the problem that I ran into.

In August of 95 I ordered a Dual Port Pico directly from PacComm. I was told that there were delays of about 2 to 3 weeks on this unit. I agreed and patiently waited, I called every two or three weeks until November when it finally shipped, three months later. When I received the Pico I was surprised to find out that most of the features advertised were not coded into the eprom. There was an errata sheet that explained what was missing and that I would get a free eprom upgrade when the code was completed. On December 15th I received a new eprom as promised (following my call to them) with the new software with most of the advertised functions operating. I had been having a problem with the unit resetting to defaults for no explainable reason. I called PacComm, in mid December to ask about this problem and was told that it must be a software glitch because they had not seen the problem elsewhere. I continued to look for the cause without any luck. On January 11th, having the Pico "drop dead" 5 times that week, I called PacComm again. This time they said that yes indeed they had a problem with Pico's and to send it back. The Pico arrived at PacComm on Jan 15th. Today, Jan 24, I called Paul to find out what the repair status was. I was told quite rudely that "it was on the bottom of the pile" and "if I wanted it fixed I should pack my tool box and come to Florida and fix it myself" And that he (Paul) didn't need this kind of problem as he had been out of town and just returned to the plant. I was then transfered to Linda to discuss my options. She, who has always been very nice, agreed to credit my card and accept the Pico back, the "right thing to do".

I have been in the electronic communications industry for over thirty years. I started my company in 1984 and have seen it grow because we treat customers fairly and, most, certainly politely. I understand that things go wrong from time to time, and that service can be a pain when engineering fails to perform as expected. However, PacComm should be more responsive to their customers and refrain from advertising and delivering a product far before it's ready to market. If you are considering the Pico I would recommend that you investigate the product and the company carefully. The six months that I have wasted on PacComm and this project have been very frustrating.

Hi Bob,

Yes, I have the same problem. It will keep parameters for a while, but after a short time, you power it up and it's lost everything. It's not just when I take it mobile...it happens in the shack, with 3 different power sources...makes no difference.

And...this is my second pico packet. The first one lost it's parameters EVERY time it was powered down and back up. I returned it and received another.

This is very dissapointing....it works fine as long as I don't power it down. I have not gotten around to contacting paccom about this one yet. Have you talked to paccom? I've got to phone them again soon about mine.

BTW im now running ver 3.2.9.2 dated Dec 10, 1995

Subject: RESPONCES ABOUT PICO PACKET
To: aprssig@tapr.org
Cc: kc4hdk@gate.net

Bob,

I have the 2 port pico paket and have had the same problems with retention of my setting's; very frustrating when one want's to operate a standalone tracker. The way I get around this is by using a nicad battery pack into the main power jack. I suspect the lithium button battery inside the tnc isn't adequate.

When left indoors my setting are retained almost all the time. If left out in the car at 40^ or less, retention is only about an hour at best.

Some of the other problems I have include garbage text when I use the help command, total lockup of the unit when put into kiss mode, and high RF leakage from the unit.

I called paccom and was advised they would be sending me a new eprom; but all I got was a catalog. I'll have to call again! I think their ability to keep track of phone message's is somewhat lacking

David E. Barrett
barrettd@crpl.cedar-rapids.lib.ia.us

Bob, saw your post and am having exactly the same problem, Am running my PicoPacket mobile and if I turn it off it will often reset to the factory default parameters. I have taken to going to O-C-T every time I boot APRS since there is about a 80% chance I have to reconfig the parmaters. I have also taken to leaving it on but am very nervous re: the surges with turning the ignition off and on. Annoying problem! let me know if you find a fix! Thanks,

Joe, AA8SF

From: John Kerr <john.kerr@marvin.projectx.com>
Hi Bob..

Just read your message about the PicoPacket resetting/destroying the configuration data held with it. I have been running the Tiny II with internal GPS in the vehicle since Dayton last year, and I have experienced EXACTLY what you have mentioned. I can go for weeks with-out a problem, then one day I go out, turn on the transceiver and find it is not keying.. I leave the TNC turned on all the time (not concerned about it drawing down the vehicle battery), so I don't know if it is seeing a spike from the ignition when I start the vehicle, or if it is just going brain-dead.

I have considered putting a large filter capacitor across the DC input to maybe smooth out any incoming spikes, but have to wait for winter to finish first...

Let me know if you find out anything....

From: Scott Miller <scottm@sierra.net>

HI Bob, Scott here in Tahoe City Ca. I have a PICO PACKET. have not yet used it as stand-alone but I will be in the next couple of days.
With the computer attched if I turn it off I lose lpath and loc most of the time. I got my pico befor 74e and Bob wapr sez it is designed as a stand-alone but that is not what I intened to buy, I picked it up at PacComm in Tampa myself. I have to use it in master mode to see myself on the map. I am looking forward to seeing Gwen's reply.And I do think he will reply
Scott ke6rke

From: msproul@arn.net (ML Sproul)

A friend of mine had the same problem. He sent it back for repair and it had the same problem when it was returned, He found that it would also reset to defaults when it was cold. He could put it in his refrigerator (not freezer) and it would reset. It wopuld do this consistently. Hope this is some additional info for you.

Yes!!!!

i gave up and bought a KPC 3.
but i needed to have a tnc for the house any way and i have not gotten to playing with the pico.
I talked to the people at paccom and my firm ware is very old
July 27 95 mine is pico sn 000034 so i have old firmware.
So this is what they told me i need new firmware they said they would replace mine b/c it was so old.
when u power up ur tnc do it in a com program or o-c-t mode of aprs and look at the date of ur firmware this may be ur problem.
hope this helps!

Subject: PicoPacket
Message-ID: <960128151902_73251.32_FHO55-1@CompuServe.COM>

I have had the exact same experience using the PicoPacket. When power was removed (overnight), it would reset to factory defaults. This is a real pain in my GPS tracker application because the GPS' NMEA output is at 4800 baud!

For this reason, I decided to change to a KPC-3 for my GPS tracker. I have had nothing but good luck with Kantronics equipment.

The PicoPacket had to be returned once because it would only transmit. It would not receive anything. I even went through all the trouble of testing it with an oscilloscope as per the book, then calling tech support. They said it was bad and that I should send it back...very frustrating.

Good luck. If your lucky you can change the battery in the PicoPacket and be in business.

Saw your post in the APRS SIG mail list. I just got the Pico myself and am having the same problem. Was going to call them on Monday and inquire about it. I've been a Paccomm loyal customer for over 10 years now. Built over a dozen of their kit TNCs. This is my first factory built unit. Cute little box. I was also going to ask them about the pin out for the 2nd serial port that isn't documented in the book. The schematic wasn't a help.

Oh, yes. The errata sheet. Was I surprised to find out a few things about my Pico on that piece of paper. Like no DCD (open squelch) or KISS mode. I never saw these features advertised, but I just figurerd they'd be part of a modern TNC...

When I called PacComm (don't know who I talked to) to discuss the Pico, the *first* thing the lady asked was "Do you wish to return it?"

> ... If you are considering the Pico I would
> recommend that you investigate the product and the company

I've had great luck with a Tiny-2 and a Sprint-2 from PacComm. But I had nothing but trouble from my Pico. I could not get it to power up from 6VDC (advertised to run on 6VDC!), or 9VDC, but only off my 13.8 VDC power supply! (There goes the portability :-) I don't know whether it had some serious problems or just a old EPROM. You should have seen the look on my face when I opened the unit and saw "PRE-RELEASE" on the EPROM! I get the feeling that the product wasn't ready to go out the door, and hence, I returned it. I'll get a KPC-3 instead...

        When Mark say's working his tail off I belive him. I had the
pleasure of meeting and talking to both Keith and Mark at the Wheaton
Hamfest and found them both to have an unending capacity to please
everyone. It also must be tough to go from the apple approach to the
Microsoft API mindset.
        The Wheaton hamfest was large and fun except for the time I spent
 taking the 2 and 3A element test. I got my first test at 8:30 and didn't
get my 3 VE signituares until 2:30 pm. I was also disturbed when I saw 3
people taking test with the no code study guides on the table and nothing
done about it.
        Meet a lot of the NIAN people and enjoyed the time chatting with
them. Special thanks to David Chesser (KA9NHL)and Ed Rogers (N9LCI). All
in all it was worth the 4 hour drive; next stop Minneaplois and
Winterfest hamfest.

Date: Tue, 30 Jan 1996 23:04:40 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960130224604.28658D-100000@greatlakes>
Rendered body type: text/plain

```
I am building an Olympic Tourch APRS map so that we can begin to plan on
our own "informal" tracking of this event.  DO NOT initiate any contacts
with any other organizations at this time regarding APRS or even HAM
participation.  Negotiatios are VERY SENSITIVE...

Anyway, my WEB brouser or their WEB page, displays lists of towns in a
pull down window.  Each window block is too long for my screen, so I can
only capture the first 2/3rds of towns on each list.  I DO have all of the
towns and  dates EXCEPT for the following dates.  If anyone else can read
the towns for these dates, I would appreciate a list ASAP.

Missing dates: May  1,  2,  3rd
                    8,  9, 10th
                   16, 17, 18th
                   24, 25, 26th
              June  1, 2nd
                    7, 8th
                   13th
                   17, 18th
                   23rd
              July  3rd
```

```
                    8, 9th
All I need is a list of the towns for each day.

The result of this collection will be a TRACK HISTORY file that you can
replay to see the movement of the torch.  If it comes through your city,
be thinking about how you can have digipeaters along the route...

Oh I almost forgot.  THe data is on the http//www.cocacola.com
```

Not necessarily APRS, but in trying to find PS supplies for digipeaters, I bought a $7 switching supply rated at 12v 3.5 amps and 5 volt 25 amps.

Results, as long as I have a 10 ohm resistor on the 5 volt leads, I have been able to smoke 8 amps on the 12 volt leads with no drop! It will probably go higher, but I am out of resistors and fear the smoking ones will trigger the smoke alarms..

Down side is that it is 12 volts and not 13.8 and the only pot does not increase it. But this suggests that you can cheat on a multi voltage supply if the other ports are lightly loaded... Lots of great deals in big 5 volt supplies out there... Without the 1/2 amp load on the 5 volt port, I can't even get 2 amps out of the 12.

Rendered body type: text/plain

The DuPage Amateur Radio Club (W9DUP) would like to thank the stations for checking into our net on Sunday night. Although band conditions were not favorable for HF, several VHF stations participated.

N9WMM	Henry-Midlothian,IL
N9LCI	Ed-Aurora,IL
N9VJQ	Barry-DeKalb,IL
N9XHP	Dan-Chicago,IL
N9JLD	Buck-Dolton,IL
N9WEB	Jeff-Chicago,IL
N9MDK	Gregg-Westmont,IL
N9ZOP	Paul-Westmont,IL
N9ZBR	John-Westmont,IL
AK9Y	Bob-Chicago,IL
WD9HSY	Brian-Mokena,IL
N9APP	Randy-St Charles,IL
N9VHW	Jerry-Streamwood,IL
N9NWA	Randy-Downers Grove,IL
WA9FFL	Paul-Rockford,IL

I don't know much about HF, and I know that some HF stations tried to get in and could not, so my question is, would afternoon be better for band conditions ? Would something other then 30 meters be better ?
One thing we learned. As suggested by Bob, put a specific digi path and not WIDE after GATE so as not to tie up other VHF networks. Can anyone thing of anything else ?
Please give me some feedback. This is a learning process for all of us, so

input can only help.
Again, thanks to those who checked-in and those who tried.

I don't see that JPL's BTEXT:

!3411.58N/11810.23W
Network node (JPLARC)
NASA/Jet Propulsion Laboratory
W6VIO Packet Switch/BBS Access System
Pasadena, CA

shows up on APRS. Yet I read the manual and it seems like it should. An ideas or suggestions?

-Greg
laborde@jpl.nasa.gov

I figured this out after I left this message for BigJon, by the way. There is no character after the "..23W", so there is nothing in the "$" or "symbol" field. Thus the beacon shows up on the POSITS list, but no corresponding symbol is displayed on the map. I fixed it, and now it works.

BTW, I am having some certain amount of fun with APRS, and am motivated to now combine my GPS-45 and KPC-3 into a portable/mobile tracker (then I'll just have to GO somewhere). I am glad I am not blazing a trail with WinAPRS. However, it looks like things will eventually go that way. I think I might be interested in getting a old Mac rather than messing with Windows '95 (but BigJon might talk me into that yet). What is the minimum Mac system MacAPRS can run on? I am suprised at the listed costs of some last-generation Macs...

-Greg

WB4APR REPLY COMMENT:  The WX report is defined to be a format within a
POSIT report.  If another POSIT comes in that does not contain the WX
data, then of course, the WX data is overwritten.  Maybe the MAC is
sending both a WX-posit report and later a normal posit report.  Seems to
me that the second conventional report is redundant.  Let me raise this
with Keith...

Subject: ACTUAL TIME

Do you know where I can get hold of a manufacturer's service manual for the
GPS? I wrote to II Morrow about buying a service manual; they called me on
the phone and told me it was not available for sale. (Strange.) But they
offered the 'operational' manual instead. Which, of course, doesn't have any
circuit description with block diagrams.

However, in general theory, it just so happened that an MIT professor by the
name of Thomas A. Herring wrote an article in the February 1996 issue of
Scientific American. I read the article and am trying very hard to
understand what he is saying. <g>.

One point he brought out was that all the satellites operate on the same
frequencies, which stumped me, because being a ham we're not used to having
2 or more stations on the same frequency without interference from one
another.

Do you find his article pretty accurate? He also says that by ranging the
pseudo-random sequences from the satellites, the receiver internal clock can
be synchronized to the Cesium clocks on board. I know it's possible to
synchronize in phase, but how is the actual time derived? In other words,
how does the receiver's clock know the time is exactly 12 midnight in
Greenwich? Is an ordinary clock such as a quartz wristwatch close enough for
the purpose? My wristwatch loses a few seconds a day. Given that one second
```

is 24 miles, that's a pretty big error. Please enlighten me. Thanks.

Most of the aviation-level GPS's are not provided with service manuals because, apparently, of the litigation fear. Or so Garmin told me a couple of years ago. Siad if I was a Garmin-approved avionics shop THEN they might consider selling it to me.

> One point he brought out was that all the satellites operate on the same

Spread spectrum with common center frequency. Each satellite has a different controlling pseudo random number.

> Do you find his article pretty accurate? He also says that by ranging the

> the purpose? My wristwatch loses a few seconds a day. Given that one second
> is 24 miles, that's a pretty big error. Please enlighten me. Thanks.

The accuracy of the free-running oscillator on the GPS receiver is pretty good, to within a second or two per day, in the boxes I've tried (mostly Motorola engines). The time-hack is subdivided to 1023 "chips" for timing purposes, and the data are sent out at a 10.23 MHz "chip" rate. the pseudorandom number (PRN) which is individual for each satellite, and known by all receivers, is used to seed the algorithm for spreading. Once the receiver determines it has a valid SS sequence for a satellite it uses its DSP subsystem, or discreet receiver channels, etc., to track in on the various satellites. The data are processed and correlated.

At the rate of data transmission, and assuming no dithering, the effective system common mode error for integer-phase-cycle shift on a single satellite should be on the order of 17 meters per chip.

And, no. A real good quartz wristwatch is not good enough.

73, Gerry

On Wed, 31 Jan 1996, Steve Sable wrote:

> Wondering if you will continue with the DOS APRS or is this it?

WB4APR REPLY COMMENT: APRS (DOS) Will CONTINUE by all means, Yes! The Sproul Bros will continue to plow forward with the WinAPRS and MacAPRS and a future X-APRS for UNIX machines. I will continue to hack away at APRS(DOS). We will be sure to coordinate all features between versions.

Although APRS74e has been the latest version for over two months (a record), there will be future versions for the DOS guys. In general, I will begin to specialize versions. Rather than make APRSxx do everything, I will separate out the WX, Direction Finding, and DX cluster stuff so that I can add bells and whistles to each...

>Wondering if you will continue with the DOS APRS or is this it?

Shame on you!
Don't even ask!

There is no GUI based program that is easy to operate mobile, especially on
a low end PC.  I just wish he could figure out how to make APRS come out in
COLOR on my laptop.  Guess we gotta make the laptop color, first.

Most folks don't want to take their fancy windows or mac machine rattling
around in the car, risking being stolen or messed up!

But I am not too worried about my $100.00 Compaq 286 laptop.

It is so simple to operate mobile, with the simple 1 finger commands.  I
could even even do it while driving if I wanted. But  Nahhh...   I wouldn't
do that, would I Bob ? :)

Windows and Mac versions certainly have their places to shine, and I use
both of them, but:

I wish DOS APRS a L O N G  and happy life.

Scott, PacComm did not write TheNet, and I am not sure if they support it
(as fas as programming help goes).

However, N4QEA (who reads this list) has one on the air with about 4
aliases. He may have even already replied to you. If not, his address is
moyers@ibm.net

I personally don't really like XiJ for an APRS digi. Not exactly sure how to
word this, but is seems like even tho it can have 3 or 4 aliases, its posit
beacon cannot follow a path. This means people out one WIDE will not see
your digi unless someone uplinks it. What a pain!

Bill is in Knoxville and we do not see his digi on the map in Atlanta. We
are 1 hop away.

Ralph

You wanted the following data on the Olympic Tourch route. The following
should fill the bill.
You didn't say if you just wanted the starting and ending cities for each
date, or all the stops.
Figuring more is better, I've filled in all of the stops indicated for each
date.
Good luck with your project.

We have somone who does this *on purpose* in the Boston area. He runs
MacAPRS with a U-2000 ! And usually alternates from WX to 'normal' beacons.

I've never seen his WX data get corupted. What happens is that his WX
data disapears!

Frankly, I don't understand why he does this. If you are going to
broadcast WX data, fine, but why intentionally make it unavailable so you
can show your Mac icon?

Hello, Scott.
In digis.txt, APR included some information I provided him, concerning my use of remote programable aliases in the X1J software program. The actual procedures for making those changes come with the supporting docs for X1J.

I now have my X1J node configured as a WIDE/RELAY digi, with all the NETOM/TCP-IP functions disabled with ACL codes and blank tables. It is essentially a "brain dead" digi, all done remotely. One disadvantage of this approach, over dedicated APRS digi firmware, is the inability to change the "UNPROTO" path for the digi's own beacon. There is some flexibility available to add digis to the path when the tnc eprom is configured for X1J and X1J4?, but I have had no reason to explore the options.

I hope this info helps.

>last-generation Macs...
>
>-Greg

A 10 year old MAC PLUS with 4 Megs of memory will run a minimal version of MacAPRS in black and white. Total cost $100-250. If I had a power inverter I might take one with me for use in the car.
Note: I would not try using less than SYSTEM 7.0.1
A used Mac II would be a good unit for Color.

It is hard to believe my oldest Mac Plus started life in Feb 1984 as a Mac-128K and with only a memory and pc board upgrade is still running a 11 year old BBS.

Download the MacAPRS software, maps and load on a computer at Computer City and play.

I hope someone on the SIG will be able to help Scott. I've told him that
I do not know enough about TheNet X1J4 to provide an answer, but suspect
that his wish cannot be done.

Sorry for the delay in answering you. I was out of the office on a
business trip all last week and am slowly catching up on the 600 email
messages that piled up.

I am confused by your question. It says you are running X1J4 (TheNet)
firmware but that the usage is for APRS. I am not familiar with that usage.
I could tell you what to do if you were using the PacComm EPROM, but I
don't know if it is possible to do what you want to do with the TheNet.

There has been some discussion of this on the SIG - maybe someone there
can suggest what to do.

73,
Gwyn

WB4APR REPLY COMMENT:

All you do on an X1-J DIGI is to make one of the other callsigns RELAY.
Use the MYHOST, or MYBBS, or MYDX.

Each of those callsigns should also DIGI.

Anyone know why I consistently get the following error when
trying to upload files from TAPR/APRS/UPLOAD?

"530 USER ANONOMOUS ACCESS DENIED"

This error occurs about 50% of the time when I am trying to
upload the latest files.  Sometime it occurs when I first
try to access the TAPR site, other times, like today, it
occurred after I had already uploaded 2 files and was
trying to upload files out of the Garmin folder.

WB4APR REPLY COMMENT:

Its in there!  I cant remember how far back tho...  when you send a
message, and it asks for you to enter message text, just enter a single
```

```
digit.  APRS will then send that existing outgoing message number to the
new station.

So that you can pre-load such messages without having them clog up the
channel until needed, send your "canned" messages to MSGx.  The X is
not used,  APRS IGNORES all outgoing messages to MSGx.  That way they
just sit there in your send buffer allowing you to "COPY" them to anyone
with only 4 key strokes: S, #, CR.  Dont forget you can also use F2 as a
REPLY key so that you dont even have to type the guy's call.
```

  I am having the same problem with 7.4h as I have with 7.3e, as follows:
I cannot switch my KAM 4.0 (also KAM7.0) from vhf to hf, using C,B,H. I must
O,C,T and use the streamswitch ~A, to put the KAM in hf. Switching from hf
to vhf, using C,B,V
works like a charm.

  I have the identical problem under plain DOS, Desqview and Windows 3.1. I
suspect
that I have a basic configuration problem, somewhere. Maxusers is set to 3/3.

  Any suggestions? A configuration file of your KAM TNC commands, from
someone that
plays with the problem features, with no problems, may very well be the cureall.

AB5GE REPLY COMMENT:

Set ALIAS to describe the node location, e.g. DONNER
Set BBSALIAS to WIDE
Set DXALIAS to RELAY
```

```
HOSTALIAS *can* be used but isn't recommended because if someone
connects to it they go into a black hole.

A beacon digipath can be hardcoded into the EPROM but can't be changed
remotely.

Rendered body type: text/plain

```
Hi Bob et al,

     Been looking at the SIG a few weeks now and have learned much
from it.

     I downloaded Beta74h.zip yesterday and am running it now.  I
stepped away for a bit and when I returned I saw on the 128-scale at
4125.71N/07506.52W the following: ":#2003E00370037" and at the same
latitude/07634.92W I saw "15".  Wondering what this was, I moved the
cursor to the spot and found... nothing!  So I hit "home" to zoom in
on the first item and they both disappeared.

     A bit later I saw them again (my cursor is normally centered on
4052.69N/07354.06W, my home QTH) and wrote down the information to
post here.  I also tried to find this stuff on the "P", "H" and "A"
lists but they weren't there.

     On to the flip side.  I very much like APRS and find it lots of
fun.  As an ARES/RACES person here in New York City I'm trying to
get my colleagues into it as there are MANY potential applications
for this program in Emergency Management.  I'm also trying to get
some stations in Westchester, Rockland, Putnam, Ulster and Orange
counties on the air with APRS.  There seems to be an RF hole up
there for APRS and I think, if my efforts are successful, it may
soon be plugged up.

     Keep up the good work Bob, and thanks to ALL the contributors
to the SIG for many helpful tips.

Hello Art.  The problem is that TAPR is currently limited to 10 anonymous
sessions in our current location.  When you get that -- it means that all 10
slots are busy.

I don't think I saw Keith post the message I posted to the system group for
reposting to the SIGs.  Maybe he can do that -- it explains what is
happening with TAPR.ORG currently.

As soon as the system is located to a faster pipe, we will increase the
number of users allowed.  I would like to do it now -- but it would be a
burden on our current host.

The problem has been our suucess.  We have out gorwn our current situation
and have been working on making a change for about 2 months now.

Sorry for the problem.  Cheers - Greg

Hello again Art -- I think Mark Sproul got the correct fix if it is indeed a
keyboard problem ?

Also -- as mentioed on the DSP-93 SIG, some folks might want to be aware of
the following. The new IP address as of about week ago is: 206.210.220.85

Cheers - Greg

---
In addition, there have been some DNS changes recently. Make sure whatever
you are using for FTP access is NOT "remembering" the old IP address in a
"hosts" file or setup file somewhere. That can make you look for the right
name, but the wrong IP address.

Scott, Pete's advice in the APR documentation is good.  in the short haul though
to ad the other digi alias's just assign the extra alias to BBSAlias, HOSTAlias,
DXCLUSTERAlais.  For a total of four alias's.

Jim i'm using the standard MKMAPKKE.EXE i think it's called. It will ask you
what features you want included in the map. You can try the new software
MKMAPV20.EXE but i have found it to be nearly useless since it crashes on
the first map of the grid of maps you are trying to make even tough the points
are very low. The last grid i was attempting to make it crashed on the number
one map and it only had 1800 points.

My wife (Valerie, N3NGW) works for Coca-Cola and they are sponsoring the Olympic Torch Relay. She has volunteered the information at work that Hams may be able to help in the Torch run.

I noticed some talk of the torch run, haven't finished reading it all, and if Coca-Cola is interested I would like to have a list of hams willing to help out in the Baltimore, MD area for communications. I think APRS would be very useful in this situation and since Coke is looking for help we could do it.

I'd like to get some support from this sig. If you would like some info, I'll try to get your questions answered, or if you'd like to offer help, feel free to e-mail me.

24. Port swiching. PSE HELP!!!!

From: pmarkham@sun.lssu.edu (Peter Markham)
Date: Fri, 02 Feb 1996 00:50:04 -0500
To: aprssig@tapr.org
Message-ID: <199602020548.AAA09436@sun.lssu.edu>
Rendered body type: text/plain

I have been living with a problem that is evident on my setup, using a KAM 4.0/7.0 and APRS73/74, running under plain DOS, DesqView, or Windows 3.1. No one else has mentioned this problem, that I am aware of, indicating to me, one of 2 major reasons for the perceived problem:

1. There is a bug in the software but no one is using the features as I am, therefore no one is aware of the problem.

2. There is no bug in the software and the perceived problem has its roots elsewhere.

If I depress, in succession, the C, B, and V keys, my KAM switches from the hf port to the vhf port and all program functions work as expected.

If I then depress, in succession, the C, B, and H keys, my KAM remains in the vhf port configuration, but the status bar indicates the change to hf. I can repeat the attempt to change the port back to hf but it will remain in the vhf configuration, though indicate the hf configuration on the screen status bar. APRS 2 port mode selection makes no difference, the symptoms are identical.

I can use the O, C, T key combination, in succession, in either port configuration and raise the command screen. From the command screen, use of the appropriate streamswitch characters ~a or |a (tilde a or pipe a) will always switch the port.

When the KAM is actually switched to the hf port, APRS works as expected.

I have touched on this problem several times, in APRSSIG messages, and over the air on hf APRS, but have received no confirmation of a problem, real or imaginary! It's as if no one wants to point out the error of my ways!

Rest assured, I do not have the hide of a rhinoceros, but I cast aside my sandles many years ago and became more humble, actually open to constructive criticism, even though pointed!

For the better part of three months I have lived with the anomoly described and am beside myself with grief, for I have yet to be offer a clue I can recognize, to extricate myself from a situation that to date, indicates my state of gross ignorance. HELP!!!!

Whatever the reason, I request, most humbly, nay! I beseech most obsequiously, that someone put an end to my misery and gimmee a clue to what's broke. For up to now, my plaintive cries have struck upon deaf ears.

I promise that I will not smile, frown, laugh or cry, regardless of how ridiculous the offered suggestions may be, for at this moment I am clutching at all straws, mine
and others, hoping that one may be my salvation.

What else can I say? ..... All help appreciated.

:-) Pete, wa4hei

Remember, its just a hobby. It's s'posed to be fun!

Which would be harder to do have a fox hunt to find the location
to within a square mile or use the freedom of information act
to find the location of a federal licensed radio station. :-)

"IF lists are outlawed only outlaws will have lists"

A grid square doesn't give that much information to a
non-ham and 6 digit grid square around Dallas is a
4.88 miles by 2.88 miles area.

You probubly can get within a block just using the third harmonic
of a 2 meter repeater.

I live in a city where most repeater sites are restricted access, I can
understand if the site is out in the woods or on a remote hill.

It was developed on Windows NT and I run it on a Gateway 100 Mhz Colorbook running NT 3.5 and on a Desktop pentium running NT 4.0 (3.51 with explorer). I had the good fortune to have Keith make a high res map of region 6 anamosa and Iowa City quad's. At least I think it was Keith???? Well that's the Name on the NIAN button he was wearing.

First impression's I have are...Mark you should never have pre realeased it! Now well be bugging you to finish up. Either that or we'll end up buying MAC's because of our impatience (their real agenda...must own apple stock) Anyway I digress.

Impression's

1) It hasn't locked up!!
2) No mapmaking cabability yet (unless you get a MAC)
3) Fast regeneration of maps
4) No access to TNC directly (can't check my tnc setting's...Oh me of little faith)
5) No HSP support (when ya got only one com port on the laptop it's tough to run a tnc and a GPS)
6) No window drag zoom in (Just my CAD mentality)
7) Shortcut key's stop at main menubar should also cover Menu items
8) Doesn't take 40 Mb of hard drive to install like typical Windows programs :-)
10) Download it run it enjoy it
11) Move the comment's on winaprs to the aprswin listserv as I shall do hence forth so we don't flood out the rest of the discussion here, that I've come to know and love so well

27. To "HID" or not to "HID"?

From: mark@tetherless.com (Mark Oppenheim)
Date: Fri, 2 Feb 1996 02:04:04 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <199602021004.CAA01220@gorgor.pa.tetherless.com>
Rendered body type: text/plain

On both VHF and HF, I have seen many stations with HID ON. This sends a ID packet (usually consisting of digipeater/node callsigns) every 10 minutes or so, depending on manufacturer of the TNC.

The problem is, many stations set their DIGIPEATER and NODE (or BBS) to a callsign of RELAY or WIDE. While this may not make a big impact for local packets, some of you that have Loooong digipeater paths or are on HF, propagate these packets down, and appear on local nodelists (mostly KA-nodes, and devices that recognise KA-node nodes) and change ad-infinitum.

Users connecting to their local KA-node may not realize that node RELAY is not local, but at the end of at least 4 digipeaters and 320 miles (as is the case with my home station in the Los Angeles area and several stations in Northern California) or 1000 miles away being propagated by a WIDE HF-gateway station.

And of course, it does tie up precious air time...

So, the QUESTION (for discussion) is:

1) Should stations voluntarily turn HID off? (remember it's NOT required by FCC rules*)
2) Should APRS software default this off?
3) Should it be used in some cases? If so, when?

* Since your station will be self-Identifying via Posits in ~10 minute intervals with your callsign anyway.

Bob announced that he was making a map of the route.
That is all that was announced.

PLEASE!!!  Do not contact people about this activity. The Atlanta Committee
for The Olympic Games (ACOG) "owns" the Torch Relay.  It is presented (paid
for) by Coca-Cola. They paid 40 million dollars, part of which was to do this.

There are already avenues in place for volunteers.  Volunteers go through
ACOG. There are ways for Hams to help already set up.  If there is any APRS
or other Ham activity concerning this, we'll announce it here first!

Please!!!   No loose cannons.

WB4APR REPLY COMMENT:

YES!,  YES!,   No probably...  The ID packets do nothing of value for
APRS(PC) other than overwrite the latest STATUS from a station.  Unless
we save ID packets to a new screen (why bother) they are not needed.
(In my opinion, since Sproul Bros may differ...)

34. USGS Maps

From: ke4eer@AIRnet.net (William Nolle)
Date: Fri, 02 Feb 1996 11:11:29
To: aprssig@tapr.org
Message-ID: <9602021713.AA10807@foo.garply.com>
Rendered body type: text/plain

Several users have asked how to make maps from the USGS internet files.
follwoing is my way and may not be the only way i'm sure.

I get the files using WS_FTP and access the USGS site at the following
address. edcftp.cr.usgs.gov/pub/data.100k/

The format has changed, you must now pick the city or town you want the
files for. Many times depending on the size of the city you find the files split
up into East and West.

You MUST only get the files that are in the OPT (Optional format). The files
will look something like this. md3.hyf04.opt.gz

There will be many many files and when you download each file you will have
to rename the file before downloading the next file. The reason for this is that
if you attempt to download the next file without renaming the last file you
downloaded it will overwrite that file. (Don't ask me why i don't know).

Example: md3.hyf04.opt.gz i rename to hyf04,gz this indicates a HYdrography
file. Make sure that all these files are placed in their own directory with NO
OTHER files in that directory. When you have all the files downloaded that
you will need for that City or Town download GZIP from the Tapr site, you will
need this to unzip these files. When you have the GZIP do a GZIP -H it will
bring up a help file and explain what switch to use. Once the files are
unzipped they are ready to use.

To make the actual maps you will need the Mapmaking software, here i have
a suggestion, Download the MKMAPKKE.ZIP from tapr. You will find several
other there with simular names. The latest is MK100V20 but it has so may
bugs that it is nearly useless (My opinion only).

Now the nitty griddy of making the actual maps is another story that i have
posted here several times, i would post it again but couldn't find it on my
harddrive Hi.

Hope this helps those who want to take the time to download the USGS files.
I think the price of the USGS CD is well woth the $35.00

>(In my opinion, since Sproul Bros may differ...)

This is OK, if and only if APRS will send out at least one packet every
10 minutes, otherwise a station may transmit a GATE'ed ot DIGI'ed packet
and then not meet the FCC requirement to ID every 10 minutes. Given the
FCC's attitude towards ham radio lately, they're not likely to ticket
anyone, but I'd rather not take the chance!

I downloaded MacAPRS.ppc 2.2.0 to play with on my PPC at work, and I am
having the same problem I remember having before. How do I get a map
loaded? I also downloaded the files:

CA_NV.map
Texas.map
New Jersey.map

which are in the same folder (APRS) as MacAPRS.

You need to put the PROGRAM and the folder MAPS into the same folder, Put
your MAP files into the MAPS directory, and everything should work just fine.

MacAPRS (Folder)
        MacAPRS (Program)
        MAPS (folder)
                <map file 1>
                <map file 2>
                ...
                <map file n>
```

```

Let me try to explain it: Installed User Base. Macs are wonderful
machines. They have been sold at unconscionably high prices and their
virtues for years were hidden behind Apple's "proprietary" approach and
gouging price structure. They then tried to make up for it by severely
cutting prices on the low end. This got them into economic trouble and is
```

likely to result in the firing this week of their CEO. The only company I know of that is more inept in marketing to the home environment is IBM. That being said, would you care to compare the number of Macs vs PC's in the ham community? I would expect the ratio to be about 1:100 or worse. Where is the market with growth potential?

Now...all the hype about the WinAPRS is because the dos version is:

1. slow
2. ugly (when compared to either a Mac or Windows)
3. written in Qbasic with all its limitations (versus C for Mac & Windows) 4. serial I/O overburdened.

This is not to say dos APRS is a bad program...rather it is written for a 1970's operating system in a hamstrung language. Given that, Bob has done and continues to do an extraordinary job. We all owe him a debt of gratitude.

So the hype is because those of us with higher end PC's that we bought in prodigious numbers at incredibly low prices now have an alternative that addresses points 1-4 above...and from the very same authors that produced the Mac version that you are so fond of. Yes, we are fired up...and for very good reason. We didn't mortgage our homes to by a Mac, and are now in the process of catching up to the wonderful work done by the Bros. Sproul.

I never thought I would find myself advocating for Windows...it goes against my grain, being a long time OS/2 user. (I have two machines here both running Warp Connect)...but your observation about "hype", implying that there is no substance to the interest in WinAPRS was way off the mark, and I could not resist attempting to explain at least some of the enthusiasm about WinAPRS. Now if there were a native OS/2 version, I would issue a message similar to yours..."what's all this hype about the Mac, OS/2 is where it really is at" and would be subject to the same analysis that I made of the MAC: installed user base.

Fortunately with versions for DOS, Win3.x/WIN32s/WIN95 & the MAC, the ham community has exactly what it needs. Serviceable and feature rich low end dos machine software and aesthetically pleasing, fast, feature rich Windows and Mac versions. We should all be very happy at the continued strength and development of these products. The authors are doing us a great service and hopefully making a few bucks as they go.

I hope this doesn't degenerate into one of these "my machine is better than your machine" or "my software is better than your software" threads. God they are tedious. Each machine and its associated software has a place at the table. I wish them all well.

Sproul Bros have made it possible to build some WORLD-WIDE maps at the
1,000,000 scale. (Typical hiway map). It still takes some time to
make an APRSpc map from their data, but I can now do it with their help.

If you are OUTSIDE of the USA, and on this SIG, please send me PRIVATELY the
center coordinates of your area of interest, number of APRS users, and
RADIUS of activity. Depending on time, resources, and interest, I
will try to do something for you.

Send to bruninga@nadn.navy.mil

With WS_FTP it is not necesary to rename each file. Under the options
button at the bottom, select session options and check the box marked
recieve unique (PC assighns names). From now on you can select all
the files you want (<ctrl> click with mouse) and your computor will
give each a unique name.

```
I've been running APRS for almost a year now with no problems, until
now. Aprs starts up OK and draws the maps, but it wont initialize the TNC.
It tries a couple of times, then locks up. My other packet program, PET
Lite runs fine.

I always start APRS from the Windows program manager. The problem didn't
start until after I nstalled some additional memory in the system.
I tried running Windows in both standard and enhanced modes, and straight
from DOS. Still get the same thing.

I deleted the APRS.cfg file and started over the setup again. I also
deleted and replaced the APRXxxx.exe file. It seems to be between the TNC
and the APRS program itself since the other program works fine.

The TNC is a KPC9612.

Any thoughts?

Thanks

This maybe true and thanks for the info, BUT i don't want a unique name for
the simple reason that the map software looks for certain characters like
HY,RD,MT etc. So if it just picks a name other then as listed would be
useless and of course wouldn't work. My question Charles have you used this
format as you suggest and then made maps with the files?.
Again thanks Charles.

```
I will be moving my 80M GATE back to 30M today till' Tues 2/6 sorry for any
problems. KC4HDK will be going to NC and I hope to be able to GATE him thru
Atlanta back into our area.

Maybe if I find time (yea right!) I will be able to complete my KAM+ VHF cable
so both GATE's will finally be in simultanious operation. I will try this
weekend but I doubt it. Lot's of honeydo HOMEwork!

54. VHF nets around GATEs

From: mlehmann@nerc1.nerc.com (Mark W Lehmann)
Date: Sat, 3 Feb 1996 02:35:26 -0500
To: aprssig@tapr.org
Message-ID: <v01530503ad38be4b5645@[205.247.120.223]>
Rendered body type: text/plain

```
My station is a 30M HF/VHF gate way located in NNJ. The VHF net around me
has more than 50 stations in the NJ/CT/NY area, and I often see up to 100
stations from MA to VA, all on VHF. The statistics log in MacAPRS shows
that my station has seen over 500 different callsigns (it ignores SSIDs)
since 12/29/95. This includes both HF and VHF.

I would be interested in compiling information from other HF Gates around
the country as to how many VHF stations surround them. Since gating from
VHF to HF is discouraged (and rightly so, (see: blivet)) it is difficult
for one area served by a Gate to get a feel for the size of net surrounding
other Gates.

If Gate operators around the country will send estimates of the size of the
VHF net around them to my e-mail address (not to the sig, please) I will
compile the info and post the result on the sig.

Thanks,

Mark WO2J

WB4APR REPLY COMMENT: Interesting question, but there are 2 answers.

1) How many VHF stns does the GATE see? (large nebuluous overlaping #)
2) How many VHF stns are within ONE WIDE? (# of stns that see the gate!)

The answer to #1 will tell you how many people could GATE from VHF to HF (an undesired mode of operation). The answer to #2 will tell you how many VHF stations can SEE the HF activity. (A more meaningful answer, since that is the function that GATEs were designed to do)

Further, the answer to #1 is so overlaping as to be meaningless. My report for that number is over 100 but includes probably 50% of WO2J's. My answer to #2 is probably 10, and that number does not overlap any other gate. (Our gate is a 1w HT on rubber duck that only hits 1 WIDE)

So in my opinion, the best way to answer #2 is to do a MAPS-PLOTS-POWER and count only the statinos that intersect with the WIDE('s) adjacent to the GATE. But also answer #1 for our curiosity too!

Reply:
Creative Labs released NEW Win95 drivers about a month ago. I've talked to several people who are using the new drivers with Win95 now. I can't use them because I don't have full-duplex hardware.

> Again thanks Charles.
>
> Bill KE4EER

Yes Bill ;

It works fine for me. My data base has filenames that reflect the
quad-map name, example. GA1 thru GA1006 (8 files with unique
names), cover the Danville, VA area. Similar CV4 files cover the
Charlotsville VA. area. However I only use the RD data I do not
download hydro. etc data only RD opt data. With the limits of slow
laptop PC`s and Dos APRS The smaller the map points, the better,
most of my maps are 1500 points or less.
After I dnload a set of files I highlight them
and rename them all to *.gz. (I use Windows 3.11) . Perhaps you could
use rename to add the prefix you desire. Rename to RD*.gz. I run
Gzip -d from Windows also, as well as the Qbasic programs.

" MAC attack" "No I don`t care for fast food either"

He He I couldnt resist a MAC cut, I see so many PC cuts from the few
Mac users out there.

The main thing is Commador 64 users have fun too!!

I have still only met one APRS user on Iphone. join private aprs

59. MK100V20.exe multi map maker

From: "Charles W. Davidson" <cdavidso@hemisphere.neocomm.net>
Date: Sat, 3 Feb 1996 13:00:16 +0000
To: aprssig@tapr.org
Message-ID: <199602031802.NAA19547@hemisphere.neocomm.net>
Rendered body type: text/plain

The multi map maker seems to work very good for me at the 1
+ 2 mile levels I have made maps of several citys. However the maps do
not overlap enough. I have adjusted the maplist range and still
cannot get seamless maps. The alternative is to make a second set of
maps to fill in the gaps. I believe it would be much better if the
author could adjust the program so that the nine maps generated are
closer together. Also I would like to see the capability of making
many more maps in one swoop. I suggest using the mapcenters to name
the multiple maps or just nameing them in series is fine. The maps
are renamed easily enough after the are finished. Thanks to the
author whose name slips me at the moment.

Rendered body type: text/plain

I just took a look at winaprs, looks nice but does it do
anything. I cant seem to I input any objects or any other commands I
use with aprs. What are some othe functioning commands in this beta
version. I loaded some 140 of my maps and can display them but can
only see a few of them in the maps pull down menu? I already had
32bit support and understand abt no com port support as yet for 3.11.

You may reply direct if you wish, I realize there is another mail list
for winaprs but, perhaps those of us that have enough mail to sort
through already can be kept upto date on the Winaprs progress, with
a note here now and then. Thank You...Charles

   I have been running numerous tnc programs with a high speed 4 port serial
card for over 3 1/2 years. Sometimes the tnc(s) is in KISS mode, sometimes
native, depending on the programs running. APRS has been running for more
than 2 years, at various times on ports 1, 2, and 3. under plain DOS,
DesQviw or Windows 3.1. At no time have I traced the problem back to the
high speed port hardware. I have on numerous accaisions found that I could
not pass data through those ports because the computer would not find them
(faulty AMI bios) or when exiting a  program that was using the port it
somehow got lost due to some imperfection in the software or my ungraceful
method of exiting the program.

   I found that rebooting the computer to initialize my lost comm port(s)
again was a pain, so I sought and found a program that would do it as I chose,
without me having to dump everything else running. I have been using
RESETCOM.EXE to reset different comm ports while all is up and running. It
is available from Computer Telecommunication Systems Inc., Duluth Ga. The
AMI bios
problem was solved using the FIX16550.SYS device driver, discussed on this SIG
recently.
```

```
   Those 16550s are sweethearts. Cut 'em some slack.

   I hope this information is well received. It cost a good piece of my life.

                                       Pete, wa4hei

```
I am still on my extended APRS mobile Florida trip. I attended the Miami
Tropical Hamboree today. (70 degree temps, BTW).

They offered tours of the new National Hurricane Warning Center (the old one
blew away during Hurricane Andrew).  I took the tour and can report that
APRS is proudly displayed there.  It was in use in the Ham Station, W4EHW
(Early Hurricane Warning) as well as on a portable cart in the Media Room
(where the press sleep on the floor waiting for hurricanes to move around).

It was up and running for all to see.  Tour guide explained ARPS (sic.) to
us and explained all about how they wished that all the Ham boaters would
put Ultimeters on their boats and run the program.

They also explained how valuable the WX reports were that came in from our
WX stations.

I spoke with the personnel at length and they are very nice.

If you are ever in Miami, it is worth a visit.  They're on the same tract of
land as Florida International University and the Hamfest site.

That is your only choice for the DOS version of APRS.  I think the Mac
version supports Heath also.

The Peet that supports baro. is not supported properly by any APRS program
or clone currently (unless someone fixed something in the last few days)

Peet Bros is the only way to go. The U-2000 has barometeric pressure,
there is excellent software for it and it will drive two different serial
ports if you have them available (one for aprs and another on a different
computer to log the wx data). I have both the U-II (older model) and the
U-2000. Both are good, but only the 2000 has barometric pressure. The
2000 keeps track of highs/lows in all categories for the last 24 hours,
72 hours and since last reset, so it retains a wealth of info. It ain't
cheap, but it is a unit that is well supported by both the company and
the aprs authors.

With that in mind: Dos APRS does not support the U-2000 yet. Bob is
working on it, but he has problems. WinAPRS has the U-2000 code in, but
it is not fully debugged as of today, but should be within the next week.

WB4APR REPLY COMMENT:

APRSpc *does* and *will* support the U-2000.  THe bug is hardware
dependent. There are lots of pwople who report that it runs just fine.
There are lots (with newer PC's that report that it does not).  We will
fix it.  Sorry for the delay, hi hi...

The 022 beta was released today and the bug is supposed to have been
fixed. I am downloading it now. I think the Mac version may have been
working fine, but dos aprs and winaprs did not work as of yesterday, but
as I said, the WinAprs version may be fixed now...will let the sig know
in a few mins.

I want to pass along that Midwinter Madness will have a table set up in
the club area for APRS. Stop in and talk to those of us who are using
APRS in the upper midwest.

We hope to generate more interest for APRS in our area.

Also John WA0LPV and Gerry N0NGW will be going mobile from Grand Forks,
ND to the hamfest on Friday evening. Don't expect many of you will see
us, but we will be giving this a try.

From: schiers@ibm.net (Robert Schiers)
Date: Sun, 04 Feb 96 20:33:21
To: ksproul@hardees.rutgers.edu
Subject: WinAPRS Beta .022 corrupted?

Keith,
I ftp'd one copy from the web site and another from TAPR.
Both failed to be recognized as intact by pkunzip (in fact
by two different unzippers).

I then ran pkzipfix on the files (both were the same size)
and it found and corrected the errors.

Note the files sizes:

W_AP022  ZIP   1294336   2-04-96  7:38p (original downloaded from TAPR)
W_AP022A ZIP   1295894   2-04-96  8:30p (zipfixed version) W_AP22A  ZIP
1295894   2-04-96  8:29p (zipfixed version)
W_APRS   ZIP   1220256   1-29-96  3:23a (original public beta release
.20) W_APRS22 ZIP   1294336   2-04-96  7:23p (original downloaded from
WEB)

The .22 beta DOES fix the Ultimeter 2000 wx problem, although I am not
sure I am seeing it transmit the weather automatically...I only am sure
it is doing it when I manually use the settings to transmit the wx.

How often should the wx go out automatically?

Thanks for the quick fix..by the way. Pressure here is 30.48 in Hb which
corresponds to 1032 mb...the display shows 32...shouldn't there be a
leading zero..032 and then when pressure falls below 1000 mb, it would
show 999 , corresponding to 999 mb? The display I refer to is the Wx
Station list under lists.

Also the Weather indication shows only temperature ...assume this is
something new you are working on. 73,

To: dbarrow@omnifest.uwm.edu, aprssig@tapr.org
Message-ID: <013.00322898.QRDS81A@prodigy.com>
Rendered body type: text/plain

Remember, some people drive Ford's and some people drive Chevie's. This is not an argument as to the preference of one platform over another. When we come down to it, this is a personal choice. I have a

friend of the last thirty years that is a die-in-the-wool Mac user and
I am a PC user. We chide each other often about this personal
preference, but we respect each other sufficiently to let the other
have that choice. Let us agree that there are strengths and weakness
with each platform. Given that, a machine and operating system should
be chosen for the closest match for the job at hand. For my old friend,
his choice for a Mac as a tool of choice was based on their needs. For
me, the choice was based on my needs. Each of use is happy with the
choice and when one of us finds it necessary to use a different tool
for a job, we put our pride aside and readily use the other machine.
You see, my friend and I learned how to use both tools and pick the one
needed for the job at hand. We are both richer and more marketable for
the learning. Many readers of this message have more then one car in
the family. Very few of them have both of the vehicles the same. Why
is that? The same reasons for different computers can be given.

Anybody in the mood to talk about an AT&T 3B2?

We have had a gate up and running for some time here in Toronto and Southern Ontario, but at least 50% of the wx spots that come in over the 30m net are corrupted.

I will post the callsigns that I see the next time I get on. Some that come to mind are KU0G and KE2VW. There are more.

We can recreate the problem here if only the wx info is transmitted.

Seems to be a waste if people spend all this money on their stations, but no else can read the data.

Bob, what is the short term solution?

cheers...mike

The above information is the primary reason Rich and I are testing the 80
M GATEFL in Florida...we are inside the skip zone for other Florida
stations using 30 and sometimes even 40 meters....not to mention the
tropical phone skip at night here on 40....

I would like to invite ideas and suggestions from all WX users on the
East and Gulf Coasts on how we can accurately and dependably provide real
time data to the TSPC (Formerly the NHC) this upcoming hurricane season...

The NWS needs windspeed in knots, wind direction in degrees, and barometer
in 0.1 millibars in real time....

You might be interested to know that ham reports over Florida were
critical when Erin crossed the state last year...enabling them to drop
the hurricane warnings earlier than expected and confirming their
forecast....the barometric and wind readings can verify the radar defined
center of the storm.....and show increase/decrease of strength....

Thanks Ralph for pointing this out...

P.S. KD4UYR Gateway is now operating on a Kenwood TS50, the old Yaesu
FT747 finally gave up....nice little rig too pumping out slightly more
than its rated 100 watts....

73 from Sunny? (temp 26 wind chill 19) Florida
de Kevin KD4UYR

Just ordered my Ultimeter 2000 - first one in the UK, unless someone proves me wrong...

There will inevitably be occasions when the laptop, TNC and GPS are committed with APRS elsewhere, and during these occasions I would like to use the 2000 in conjunction with another TNC as a weather-information node. I know that the 2000 has a mode which allows it to respond to modem or TNC commands, but I had in mind something which didn't involve the remote user needing to know the 2000 commands, and which perhaps presented the remote user with a menu or some other more friendly presentation in order to view either current, or archive; weather data.

Does anyone have such a system running, or could anyone point me towards any PC software which might achieve this?

regards,

Bob

Dear Bill

The sales of Macs has NOT been "dropping like crazy", in fact, Apple has had record sales volumes (in numbers of units) and was the 2nd highest company in sales last quarter (again in units shipped). Apple has sold over 1 million PowerPC computers, more RISC based machines than all other RISC based machines put together. You are of course correct that PCs outsell Macs in most of the market, but in the market that I work in, graphics and publishing, Macs outnumber PCs 10 to 1.

```
BTW, the developement of WinAPRS, is done entirely on a Mac, I right the
code on a Mac, Compile it on a Mac and even run the debugger on a Mac which
commuicates to the PC via TCP/IP were the code actually runs.

Mark

WB4APR REPLY COMMENT:  Nothing on packet can be CORRUPTED unless someone,
somewhere has PASSALL ON.  There is nothing worse in the entire universe
of APRS than a digi or gate with PASSALL ON.

Everyone should persue with extreme dilligence to eradicate any TNC with
PASALL ON, hihi.  WIth generic callsigns, it is extremely difficult to
locate, but wrecks APRS data over many states... hi hi..  GOOD LUCK!

WB4APR REPLY COMMENT:  The U-2000 has a packet mode.  Just take ANY TNC,
put it into unproto converse, and hook up the 2000.  The 2000 will send
out a WX report once every 5 minutes.  Use one of the newer TNC's that
can be configured to power up into UNPROTO CONVERSE...

Expect some APRS bugs with the U-2000, tho.  We are working on them...

We have had exactly 2 people with this problem, I do not understand it.  I
have fixed it so it doesnt quit as it currently does.

It might not be finding the CFG file, I am not sure, make sure that
WinAPRS.EXE and WINAPRS.CFG are in the same folder (directory) and that
they are NOT at the top level.  If you come up with anything, let me know

If you continue to have problems, I will send you a new version

Mark

Rendered body type: text/plain

```
Aloha Y'all. Dave here in Hawaii, where our record low temps (upper 50
degress plus) have not broken water pipes, cut electric lines, or caused us
to slide off the road (an unpaid advertisement from the Dept of Hawaii
Tourism Bureau).
```

During the upcoming couple of weeks, Feb 12-29, I'll be APRS/GPS mobile in and around the following cities as I drive my car from Arizona to Washington state: Tucson, Phoenix, Flagstaff, Salt Lake City, Pocatello, Butte, Missoula, Coeur d'Alene, Spokane, Seattle, and Tacoma.

If you live nearby any of the above cities, please send email and tell me your APRS frequency and digi ID.

Gear used will be a briefcase APRS kit with Icom W2A, 30 watt amp, KPC-3 and Garmin 45. Hope to have my 2M voice radio installed as well, with a decent antenna, and will monitor 145.52, or known repeater freqs, while driving.

Would be glad to show off my gear to anyone who would like to see it. Have been an active APRS user since 93, former TX State APRS Coordinator, and soon to be former HI State APRS Coordinator, as I move to WA state (maybe will be the WA State APRS Coordinator, if position isn't already taken). Lots of map making experience, include number of west TX, Tucson, San Diego, Spokane, Bremerton, Puyallup, and other smaller maps. Mac at home, DOS at work/portable station.

So look for WH6YC-9 APRS GPS mobile and drop me a line. Aloha, Dave.

Help!!

I have an Eagle GPS, a KPC-3 and an AEA HSP SWITCH (I also have one that was made up for me). My APRS runs fine without the switch plugged into the back of the TNC. When I start APRS with the switch inline, when I check the unproto and it always says NONE, when I go to change it it stays at NONE with no digipeater path.

Does anybody have any idea what is wrong!!!!

I leave for a trip in a week and I wanted to use APRS, but the way its going it wont make it.

Looking for help

Tom

I had this same problem with the invalid reg number but it was a easy fix, I
screwed up! I did not have the CFG file in the correct location, that was back
when the .EXE file was going out instead of a complete package.

Check this first it may be as simple as that.

Maybe I'm missing something here......I don't see how an Ultimeter can
work properly on a boat. At least as far as wind *direction* is concerned.

You'd have to constantly monitor your heading and constantly change the
'correction factor' of the Ultimeter. Not very practical IMHO.

Yes and how about the rain guage, would have to be mounted on a Gymbal
or something to keep it level all the time. In any case it would not be very
accurate Hummmm.

I posted this once before but didn't see much response. Has anyone did any
research or own a  GPS31 TrakPak (tm) GPS receiver. Looks like a great unit
for a standalone tracker since it's only 2.23"x3.8"x1.04" and is totally sealed
in a waterproof housing. Includes receiver antenna (Tracks 8 satellites) it has
an 8 conductor cable coming out of it for tha data output of Pos,Spd,Time,
Receiver and Satellite status. NMEA 0183,RS-232 RTCM-104 inputs. And the
best part is that West marine has them for $230 i believe.

114. APRS compatible WX beacons in LA area

From: mark@tetherless.com (Mark Oppenheim)
Date: Tue, 6 Feb 1996 03:00:09 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <199602061100.DAA09293@gorgor.pa.tetherless.com>
Rendered body type: text/plain

```
Bill, KB6CYS has been running real-time WX information on 145.010 in the Los
Angeles area for approximately 10 years.   He was written up in a TAPR PSR
and QST as the first amateur to couple a WX station to a TNC and make this
data available to the public.

His station consists of a ORIGINAL Heathkit WX computer, with it's "wierd"
TTL parallel data interface.  This is interfaced to a (don't laugh) Apple ][
computer and a IBM PC - the Apple doing all of the interface and dialog with
the WX station, and the PC handling TNC/connect duties (well, it USED to be
a PAIR of Apples!).

Anyway, I convinced him to send APRS-compatible WX packets, and since Sunday
night, that's a reality (it's just too bad that most of the APRS activity in
the LA basin is on the 146.745 duplex repeater, and not on 145.010!).  The
station now reports temperature, wind speed and direction in "APRSese".
Soon, he'll add the rain reporting function - however, since this is "rain
per hour" not a 24 hour cumulative total, this is a bit tricky (Bob, this
may be a thinly veiled request for advice on how to handle this...) but, the
bottom line is, it works!

Of course the station LOOKS like just another APRS WX station on the screen,
and we noted that putting "!" (to denote it as "not running APRS") in the
first character in the posit (rather than "@") did not cause the post to
occur.  Some stations may THINK it's an APRS station and try to send APRS
messages to it, or send it WX queries (well, I have him working on the
```

latter one also...), and of course, it won't respond.

So...

1. Should there be (or is there) a symbol for non-APRS WX reporting stations?
2. Should we worry about this?

PS- - If there's someone in the LA Basin with a KPC4 (VHF-VHF) that would like to digipeat Bills packets to the input of the full duplex macine, I'm sure that Bill would give you his blessing and cooperation!

115. WX reports and the TSPC

From: Kevin Heyboer <kheyboer@pinegov.co.pinellas.fl.us>
Date: Tue, 6 Feb 1996 12:23:15 +0000 (EST)
To: "aprssig@tapr.org" <aprssig@tapr.org>
Message-ID: <Pine.SUN.3.91.960206120806.7984D-100000@pinegov>
Rendered body type: text/plain

I find it very interesting that instead of making suggestions on a method of accurately providing weather info to the TSPC via APRS, certain members of this sig point out the technical impossibility of getting automated reports from moving vessels....

Next time you are on HF....look for WB4GQK in St. Petersburg, Florida. He spends the entire summer taking reports via HF on the marine nets and via Marine Band HF and VHF and then entering them into MAREPS (The National Weather Service Marine Reporting System). He often uplinks the positions of these vessels onto the APRS map.

Bob does this as a public service. He does not get paid for it and he has been using APRS for this purpose since version 1.0.

Some of us care enough about our communities to provide services the government cannot do without spending billions of our tax dollars...

Accurate weather measurments well outside the immediate area of a tropical system are necessary to properly forecast movement and direction. Those of you who live inland may not have anything to worry about..but even Northern Alabama got hit by a hurricane last year.

Early warning saves lives and property....possibly your own.

So, instead of complaining about such things as technical difficulties and corrupted weather data from stations...how about making helpful suggestions on how to solve those difficulties....

For instance, it is correct that an Ultimeter would not be an accurate wind guage on a moving vessel...however, software could be used to compare GPS data of speed and movement against the weather data to extrapolate the true winds speed and direction....

Or, a more simple solution....the captain of the boat enters the WX manually after computing the above information himself....

Thanks for your time.

I am using the Garmin GPS-45 with external antenna, AEA PK-12, and 30-watt
rig as a stand alone tracking in my mobile. I find that the GPS-45 shuts off,
I believe from RF from the 2-meter rig. I've had to seperate the two antennas
by about 8-feet to eliminate the problem. Would prefer both antennas on the
roof of the pickup truck. Anyone with similar problem?

Aloha Y'all. Dave here in Hawaii, where our record low temps (upper 50
degress plus) have not broken water pipes, cut electric lines, or caused us
to slide off the road (an unpaid advertisement from the Dept of Hawaii
Tourism Bureau).

During the upcoming couple of weeks, Feb 12-29, I'll be APRS/GPS mobile in
and around the following cities as I drive my car from Arizona to Washington
state:  Tucson, Phoenix, Flagstaff, Salt Lake City, Pocatello, Butte,
Missoula, Coeur d'Alene, Spokane, Seattle, and Tacoma.

If you live nearby any of the above cities, please send email and tell me
your APRS frequency and digi ID.

------------------------

Dave, Salt Lake City is operating on 145.15 (no tx/rx offset) until we get our
145.79 coordination.  There are a number of non-APRS stations which beacon
positions (most of the tcp/ip group), so you should see activity all the time.

The widest digi you can get to is KF7TA on Farnsworth Peak (9000'), but he's a
TV transmitter engineer and is only at that site every other week.  Try it when
you get within a hundred miles or so of here and see if he's up.  When up, his
beacon has his posit, so he'll show up on APRS as a digi.

KF7TA is NOT aliased, so you need to specify him disreetly.

RELAY, WIDE should work within about 40 miles of SLC, there are a number of
RELAYs, and I'm temporarily aliased as WIDE from my home qth on the weekends.
If you let me know firm dates, I'll alert the local forces and keep my node up
24 hrs so the WIDE will work.

We also have a 30m GATE (KB7DD) that operates on the weekends and on demand.

Try these unproto paths:

KF7TA, WA7SLG-14  (this one gets into my node at work, which is practically
deaf)

RELAY, WA7SLG-14

RELAY, WA7SLG-14, WIDE

Stations aliased as RELAY:  N7YOQ, KC7CO-2, KB7DD, KJ7HZ, AA5SL, AA7AA

Station aliased as WIDE:    KC7CO-1
```

```
High level Digi - no alias: KF7TA

I trust this is totally obscure!
73!

Doug
KC7CO

  I have been a small part of the active recreational sailboat scene for
about 4 years, while living in Florida, and a recreational sailboat scene
observer/dreamer for many more.
  It has been my experience as sailor and observer that large recreational
sailboats in particular and most other larger recreational boats spend far
more time at anchor or moored, in protected waters, than underway. I get the
distinct impression (I have no records) monitoring boat activity on APRS
that 99% ? of the marine activity shown is from recreational vessels at rest.
  Given my observations of recreational vessels in the flesh and monitored
APRS activity, the argument based on incorrect data from moving vessels
carries little weight, with me.
  I miss the uplinked reports of the marine activity from GQK and others,
but considering the increased APRS 30m activity, I will bite my lip.

> 8:30 pst

I'd like to confirm what Scott Miller posted.

This message applies only to PicoPackets with the open squelch DCD option, the second serial port option or the internal GPS option, both battery pack and external powered models. In other words, it applies to circuit board revison 1.2 only.

We have found that the memory loss problem is due to the manner in which address decoding was done for the clock chip which is part of the second serial port and GPS options. This decoding is part of every revision 1.2 board whether these options are installed or not. During initialization the decoding will sometimes cause the the microprocessor to try to execute the clock instead of the EPROM code at that address. If this happens, the microprocessor executes invalid code and may corrupt the battery backed RAM before resuming the normal initialization. When it checks the RAM checksum later in the initialization process, it finds corruption and loads default parameters.

Also, the three position power switch used on all revision 1.2 boards can cause a glitch if it is quickly popped from ON through the center OFF into the other ON position.

We are mounting a recall of all such units so that we may modify them to eliminate the memory loss problem.

The memory decoding circuit will be rewired to eliminate the clock problem.

Power switches on standard models will be modified to block one of the ON positions, thus eliminating the 'switch glitch.' On second serial port and GPS models, which require the three position switch, a large capacitor will be added to prevent the glitch.

Units will also be updated with the latest EPROM (now containing KISS) while at the factory, and any battery pack fitting problems will be taken care of.

There are several ways to tell if your unit is revision 1.2:
a) there is a power switch on the 'bottom'(rear) of the unit.
b) It has an open squelch DCD board which mounts vertically just inside the bottom (rear) cover.
c) It has the second serial port option or GPS option.

Readers of this posting may opt to send their unit in now for the modifications, or wait for the recall letter. We will be trying to phase the recalls over several weeks time to limit the amount of time each unit spends at the factory.

Address any questions to the e-mail address below.

WB4APR REPLY COMMENT:

Donno about the UNPROTO path, but does it work otherwise? Does it give you GPS data and TNC stuff? Is the UNPROTO the only problem?

```
If your HSP is not working, you can always replace it with a SPDT switch
push button and manually press the button whenever you need a POSIT.  It
will work enough to get you going on your trip.  Set up APRS in the SPM
mode instead of HSP mode if you are going to manually siwtch....

Hi, Earl. RE: trouble with GPS 45 shutting off.

I am running a GPS-45 with a Motorola external antenna, feeding a KPC-3 TNC
and a Kenwood 2570 rig running 70 watts right now (Note: I know that's too
much for normal use, but we don't have a WIDE here yet!).

I have had no trouble with unusual operation of any of this equipment. The
Motorola GPS antenna is mounted just inside the center of the windshield on
a '94 Chevy Caprice. The transmitting antenna (5/8 wave) is located on the
forward edge of the trunk on a trunk lip mount. Distance between the
antennas is not more than 10 feet, although the two meter antenna is outside
and the GPS antenna is inside the car.

Are you sure you have a good solid power feed to everything? I have had
trouble in the past with high power rigs pulling the power feeds down, and
had to go to some trouble to make sure that didn't happen on this car.

  73, Claude
      K5DTN

Not only that, but you'd need to take in to account your speed, since that
will affect the apparent wind velocity and direction.  However, some boats,
particularly some racing sailboats, already have a setup to do exactly that!

... from knowledge gained as occasional rail-meat aboard "Deception", a
Santa Cruz 50 out of Marina Del Rey, CA before it was sold.  :-(

Is it possible that the Garmin is turning off by itself, and not due to RFI?

>From the "Operation Setup" menu, select mode "Normal" - - not "Battery
```

```
Save".  Battery Save will turn off the GPS unit if it cannot locate
satellites in a pre-defined time interval.   This may also apply if you LOSE
satellites for a period of time.

GPS antennas should rarely, if ever be placed in the proximity of a radio
running such high power, without some RF bandpassing.  I have seen this
destroy some ACTIVE GPS antennas.

In the same vein, I just ran across a antenna catalog from Dorne and
Margolin in Bohemia, NY (516-585-4000 and 516-585-4810 FAX) that manufacture
some combination Cellular/GPS antennas, if anyone's interested.  Since
cellphones transmit with less than 4 watts of power (and they use a internal
or external diplexers), this should not be a problem.

These antennas won't be cheap, however.

I can't believe what I am reading here....the Bros. Sproul have done
EXCELLENT WORK both in programming and PR regards the WinAPRS program.

Without them, there would be NO WINAPRS, period, exclamation point!

And, $60 is a great price for windows software, especially graphics
intensive software...have you looked at retail software prices lately....

They could sell the rights to a software house that would then charge
double the price....

I, for one, am waiting patiently for a version that works with Win 3.11...

and I am sure that will come with time...and I will gladly pay for it
when it does....

Remember...the more you bother Mark and Keith...the less time they have
to write and debug the code....

Subject:        [APRSSIG:6569] GPS

·       I posted this once before but didn't see much response. Has anyone did any
·       research or own a  GPS31 TrakPak (tm) GPS receiver. Looks like a great unit
·       for a standalone tracker since it's only 2.23"x3.8"x1.04" and is totally sealed
·       in a waterproof housing. Includes receiver antenna (Tracks 8 satellites) it has
·       an 8 conductor cable coming out of it for tha data output of Pos,Spd,Time,
·       Receiver and Satellite status. NMEA 0183,RS-232 RTCM-104 inputs. And the
·       best part is that West marine has them for $230 i believe.

The GPS31 is basically a GPS45 without the display or user interface.  The GPS
engine, according to Garmin, is exactly the same as in the 45 and 40, although
disassembly of a 45 or 40 shows that the RF boards are in fact different; most of
the chips are the same, though.  The advantage of aTrakPak over a 45 or 40 is
lower cost plus it automatically comes on when power is applied; a 45 or 40 does
require someone to push the "on" button.  The disadvantage is, of course, that it
has no display or user interface - no moving map, no track history, no waypoints,
etc.  Of course, if you're making a dedicated tracker, you don't really need all that
stuff anyway.  BTW, Garmin also makes a 12-channel TrakPak with vastly
improved performance over any of their handheld units.

Subject:        [APRSSIG:6571] WX reports and the TSPC

·       For instance, it is correct that an Ultimeter would not be an accurate
·       wind guage on a moving vessel...however, software could be used to
·       compare GPS data of speed and movement against the weather data to
·       extrapolate the true winds speed and direction....
·

As long as you kept weigh, this might work; however when your vessel slowed
to, say, <5 kts the data would be worthless due to the GPS's inability to
accurately measure speed and direction at low speeds, due to inherent
errors and SA.  As far as *direction* goes, get a digital compass (solid-state,
digital output - available and cheap) and use it's output to correct for wind
direction.  This could be done automatically with a cheap microcontroller
like a Basic Stamp, for example. It could input and output NMEA data,
outputting exactly what it inputs - *except* course/heading.
I'm still thinking about the windspeed problem.

·       Or, a more simple solution....the captain of the boat enters the WX
·       manually after computing the above information himself....
·

That's a fine way to do it, too.

·       Thanks for your time.

At the risk of asking about something that's already been covered................

We had record low temperatures here in Ohio during the past few days. During the period, I noticed my U-2000 showed the temp with a (-) so I knew it was "below zero". My APRS, though, sent it out as a positive value.....so a temperature of -5 became 5 degrees!

Is this a known bug? Or do I have to do something to correct the situation?

Thanks for your help.

I suspect that if you compare the amount of traffic on 146.745 to the 145.79 freq you'd find a heck of a lot more traffic on .79. There's a huge San Diego group, a bunch of mobiles, folks in northern SD County and Orange, out in the Inland Empire and a cluster of 5-7 guys in LA's South Bay. Then there's 5 or so up in the SG and SF valleys, and more seem to be appearing every day. We have a full time 30m gate courtesy of the SD guys and two WIDES. There's a fair amount of message traffic going on, a bunch of WinAPRS betas, and we'd love to have a full time wx station. I'm very familiar with Bill's since his has always worked well and has been around since the dawn of packet. Have him come up there and run WIDE,WIDE,GATE!

73 - Jon NW6H

______________________________ Reply Separator _________________________________
Subject: [APRSSIG:6570] APRS compatible WX beacons in LA area
Author: mark@tetherless.com at Internet
Date: 2/6/96 8:20 AM

Bill, KB6CYS has been running real-time WX information on 145.010 in the Los Angeles area for approximately 10 years. He was written up in a TAPR PSR and QST as the first amateur to couple a WX station to a TNC and make this data available to the public.

His station consists of a ORIGINAL Heathkit WX computer, with it's "wierd" TTL parallel data interface. This is interfaced to a (don't laugh) Apple][computer and a IBM PC - the Apple doing all of the interface and dialog with the WX station, and the PC handling TNC/connect duties (well, it USED to be a PAIR of Apples!).

Anyway, I convinced him to send APRS-compatible WX packets, and since Sunday night, that's a reality (it's just too bad that most of the APRS activity in the LA basin is on the 146.745 duplex repeater, and not on 145.010!). The station now reports temperature, wind speed and direction in "APRSese". Soon, he'll add the rain reporting function - however, since this is "rain per hour" not a 24 hour cumulative total, this is a bit tricky (Bob, this may be a thinly veiled request for advice on how to handle this...) but, the bottom line is, it works!

Of course the station LOOKS like just another APRS WX station on the screen, and we noted that putting "!" (to denote it as "not running APRS") in the first character in the posit (rather than "@") did not cause the post to

```
occur.  Some stations may THINK it's an APRS station and try to send APRS
messages to it, or send it WX queries (well, I have him working on the
latter one also...), and of course, it won't respond.

So...

1. Should there be (or is there) a symbol for non-APRS WX reporting stations?
2. Should we worry about this?

PS- - If there's someone in the LA Basin with a KPC4 (VHF-VHF) that would
like to digipeat Bills packets to the input of the full duplex macine, I'm
sure that Bill would give you his blessing and cooperation!

> carries little weight, with me.

If you are moored at a dock, little problem. But if you are anchored
isn't the vessel free to rotate around the anchor point with the
current/wind?

Besides, it was my impression that the original request for more marine
APRS WX was for reports where there is no one else to report (ie. moving
vessel that is underway)

As I said earlier about the GPS 45 (but holds true for other consumer
     GPS units I've played with):

     5) Receiver (or LNA in antenna) can get swamped by HF transmitter, VHF
     transmitter, UHF and SHF transmitters.  Can't transmit too long (20-30
     sec continuous) on 2m (45W) or 7 or 14 MHz (100W max) without losing
     satellites.  GPS antenna is hood of truck (Suburban), right side,
     forward of windshield abt 8", all VHF/UHF/SHF antennas on roof, HF
     antenna at rear left bumper of truck.

Try   http://www.ccnet.com/~rwilkins/

General APRS is at              http://www.ccnet.com/~rwilkins/aprs.html
Northern California APRS is at  http://www.ccnet.com/~rwilkins/aprsinfo.html

There are pointers to all the various flavors of the APRS programs.

The cAVe group has many interesting pointers for the Vhf amateurs, nation
wide as well as packet band plans and coordination for California.

I have seen RF START the Garmin-45 but never shut if off,
but I have seen the unit turn it self off when I have parked in a garage
or car port and there was no GPS coverage for a long time. The shutdown
has a 3-4 sec countdown timer,hard to see how a pulse would stop it.

Low power or an intermittent short in the internal or external GPS antenna
would shut it down faster. ( don't slam the car door on a active
Garmin GPS antenna coax)

I was using a 8 watt HT and a rubber duck antenna next to the Garmin
unit when the RF turned it on. I have had no problem with a external
car antenna and a 30-35 Watt brick.

Hi Bob,
I checked my passall, and it is off.

Here is what I see on the screen

```
KE2VW   U20: R MPH OTE f   (when I press the N key)
```

when I check the P list I see:

```
!******/4238.76N/07834.88W_U2000 REMOTE Weather
```

and

```
AA2AC-2  REM:e MPH St F
!******/4259.21N/07839.48W_Remote WX STN Clarence NY
```

What do you look for in the string to vailidate the report as a weather report,
and not to confuse it as a position report?

These are just 2 local weather stations. I checked with the local mac users,
and he sees the wx from theses stations correctly.

Many thanks in advance...mike

This is important. Also, makesure the GPS-45 has good batteries
installed. It will do a powersave shut-down if the batteries are low,
even if it is plugged into an external source.

I forgot to mention in my original post, the GPS-45 will do the powersave shut-down even though it is configured for NORMAL operation, should the batteries be low, regardless of the state of the external power connection.

On Wed, 7 Feb 1996, Mike Walker had noticed "garbled WX data"....

```
> I checked my passall, and it is off.  Here is what I see on the screen
>
> KE2VW   U20: R MPH OTE f   (when I press the N key)
>
> !******/4238.76N/07834.88W_U2000 REMOTE Weather       (on the P-LIST)
> !******/4259.21N/07839.48W_Remote WX STN Clarence NY
```

WB4APR REPLY COMMENT: The N key shows you the data from all weather stations. IN this case, those WX stations are not sending WX, therefore the N key is showing you that they have no current WX. I just never got around to adding additional code to say "this is not WX, so ignore it..." Maybe if I have room in a future WX only version...

I have been using MAPFIX versions for some time on a big digitizer with 4 buttons. It also worked on my little 11 inch one too with just a pen.

BUT last night I went back to the PEN board and it did NOT work. Apparently a change I made back in MAPFIX17 to add more functions for the 4 button digitizer screwed it up for my PEN tablet. Seems my pen puts out a KEY1 instead of a Key0 when it digitizes a point. So MAPFIX17 onward does not ADD a point, but begins a new RED ROAD!

It is now fixed in MAPFIX20 which will be released in a few days... No one had complained, but if you tried a one button digitizer and it didnt work this way, then you can try it again with MAPFIX20...

Rendered body type: text/plain

Earl noted:

>I find that the GPS-45 shuts off, I believe from RF from the 2-meter rig.

The battery save mode may be a problem if you turn it on and start moving before you get satellite lock. I've found that the GPS-45 takes much longer than some other GPS's to acquire a good lock while moving, especially if the route during startup has intermittent views due to tree canopy or frequent overpasses.

If you've eliminated the battery save mode and an intermittent in the antenna lead, you might want to check the quality of your ground plane connection on your 2m antenna. A frequent source of RF-related headaches (like messing with car electronics) is not having direct ground contact at the base of the antenna, such as would be the case with a mag-mount or a glass-mount antenna. It creates strong RF fields in places you don't want 'em.

```
I have a GPS-45 with Garmin's "hockey puck" external, which I've modified into
an permanent antenna on the roof of my truck. It is less than 1 foot away from
a 6m antenna, and within 3 feet of antennas on 2m, 220, 440, and 1.2GHz. Even
50W (10W on 1.2G) on any of these bands has yet to cause problems with the GPS.

*My* biggest problem with the GPS is the RFI *it* creates! :-)  147.315 is
unusable when the GPS is on.

actually, they are quite useful on sailboats and indicate "relative" wind
direction, which is what's important to keep the sails full.

Yes, but *absolute* wind direction is what NHWC wants, since they
don't care which way your craft is heading.  For local use, relative
wind vector is what you want - but *not* on APRS!  I think that's
what the person you responded to meant.

I have two Garmin 45's.  Both with version 2.32 firmware.  Neither one shuts
down during external DC operation, and I've had them on for over 7 hours at
a time.  I run the NORMAL (not Battrey Save) mode, and have set BACKLIGHT
TIME to 0, so that it stays on - which should not affect the shutdown time.

I have had the batteries down to 1/16" on the battery meter - and when
externally powered under this condition, it still stayed on... only beeping
madly if I turned off the ignition, and disrupting power to the unit.

Outside of that, perhaps it COULD BE RF getting into the unit, or a power
supply problem (noise).

... strange.
```

Rendered body type: text/plain

-- [From: Peter Gross * EMC.Ver #2.3] --

Finally got the hf installed. Not sure if is the final installation, however. I put the "Hamstick" antenna on the front - side of the plastic bumper of the truck. Then I ran a small sized ground strap to a bolt that holds a bracket for the alternator onto the block. I scraped the paint but really need a star washer. I think I'll try to find a bolt hole that I can dedicate for the ground. I see one about 5 inches away. The strap is about 6 feet long. I am telling you these details to see if anyone has any suggestions for changes. The feed line is mini 8X and is about 30 feet long.

The Zenith 386-16sx puts out plenty of noise while the screen is lit. I installed some toroids from Radio Scrap on all the cables from the tnc at the tnc. It helped some, actually quite a bit but not good enough. Noise at its lowest is about S-5. High beams and turn signals got to S-9. The truck is computerized, when I turn off or start the truck I first turn off the radio. Then when I turn it on I can watch the S meter start at S-9 or more and within about 15 seconds go down to its low point. I guess the truck computer needs time to do its thing staring and stopping. Haven't tried the windshield wipers yet. But my concern it getting out to you all which probably isn't affected very much or at all with these other noises. I'll try to listen to my signal before I leave here at the house but I haven't much time, so if you see me then try to force -14 to talk to you and see what you hear or don't hear. I just don't think
I am doing as well as I can....of course mobile at 10 mHz might not be very easy!

Any suggestions are very welcome. Send any comments to JOe kb4fo, internet address: jloewy@zim.com I talk to JOe on the LL several times a week.

As of this writing I will leave for Ga Congress Convention Center in Atlanta in the morning loading for the NJ to MA area. I am vhf and hf mobile with the GateWay on! The gateway is an experiment, hope it doesn't mess anyone up....can't wait to hit the Huntsville, Al area with it!!!

The use of an electronic compass (Jameco sells them) would work very well
for correcting the wind direction. The wind speed could be corrected by a
pickoff from the boat speed log which are usually electronic much like the
modern automobile electric speedometer. If the boat doesn't have a speed log
then it should have for dr purposes when your fancy electronics goes
bellyup. :>)
The current should not have a major effect since the NWS is mainly
interested in weather circulation patterns not absolute speed. The 80C51
family or the Basic Stamp would be ideal for this application as both have a
serial output capability.

OK Bob, thanks for taking the time to explain it.  My concern was people were
sending wx reports that we couldn't see.  If they send a WX report and then a
Position report, do we loose the wx report?

(BTW,  I've worked in Software Support for decades, and "corrupt" is a valid
description of data being reported incorrectly, or being stored incorrectly)

Many thanks...mike

Hello to all. I have been subscribed for a few weeks or better now and understanding somewhat what is all going on and most interested.

However wonder if someone can point me into or some others that may come on line to some basics of what all this is about vs jumping right in the middle. Lots of various comments as to what to do and why but for newcomer it can be a bit confusing. An email a few weeks back was helpfull in what to set the tnc to etc so we dont plaster various junk out. But I for one would like to have some more details.

Worked a few stations on HF but just short one liners etc. So again any information more specific would be appreciated.

Thanks.

Jim

> >

WB4APR REPLY COMMENT:  Actually, in recent versions, this should only
happen the FIRST time you get a BEACON POSIT from the remote WX and
BEFORE you get a WX packet.  Once you get a WX packet, it should
overwrite the the WX data into the posit, and from then on any future
BEACON POSITS from the remote TNC will NOT overwrite the P-list...

If this is NOT working correctly, then I need to fix it.  Pse confirm
what version of APRS you are using, and if you are seeing TNC WX
POSITS (BEACON) overwriting WX data on the P-LIST.

Thanks!  I was about to release a new version, but will wait...

Rendered body type: text/plain

```
Jack Swift noted in reply:

>if anyone has a fix for this exact problem [GPS RFI on 147.315]

I certainly do wish that I had a fix, although with relatively limited input I
believe the problem with this particular frequency is probably Garmin-specific
or maybe even GPS-45 (and 40) specific. Before getting the Garmin I had a
Metrologic and didn't notice any problems in 2m, but *it* would clobber a pair
of 70cm freqs, 442.500 and (strangely enough) 447.500.

The 147.315 problem is so severe that if I leave the GPS on in the truck it
will foul my base station, too, with the antenna some 70-80 feet away.

As a group we might want to explore different brands of GPS to see if the
problem differs between makes and models. I will happily catalog any ham-band
RFI from GPS's, and if it gets to a half-dozen or so post the list here and the
FTP site; "none observed" also counts!

The *correct* procedure to examine for RFI is to turn off all other electronics
in the vicinity (esp. computers, which includes car systems!), *including the
GPS*, and then sweep the band with the receiver. An auto-scanning VFO works
well, a scanner using "search" would be faster. Note any "birdies" or other
interference present without the GPS on. Then turn the GPS on and wait for full
satellite lock. Sweep the band again, then noting any *new* frequencies that
stop the scan. For each freq on this new list, manually tune to it, and then
turn the GPS *off* and then back on. If the signal goes away and then reappears
with powering off and on, then you have a hit. I emphasize this procedure
because - from experience - it's very easy to jump to the wrong conclusions in
RFI location.

Rendered body type: text/plain

Re: EMI caused by GPS receivers....

I've used a Magellen Navigator for a couple of years now when Roving, particularly in VHF contests. Learned VERY early on that it produced a birdie near 144.202 MHz. Wiped out the calling frequency. When roving, I'd check my position (to be sure I was in a new/different grid), turn it off to operate, and turn it back on when it was time to move.

Sept '94 contest I operated at home, and was plauged with a "comb" across all of 2m, 432MHz, and to a lesser extent, 222 MHz. About every 25 - 26 kHz, there was a "buzz..." shhhh--shh--shh--shhhhh, etc. I DO have a noisy local environment to begin with, and so it didn't occur to me that it was something that I was doing.

Long story short, it was the Magellen, sitting in the car, in the garage, trying to lock onto a satellite. I finally found it when I turned off EVERYTHING in the house (pulled the main breaker, and ran the FT-736 on batteries), and it was STILL there. I went to back the car out of the garage to roam around the neighborhood, and lo and behold, the GPS was on. I turned it off, and no comb noise. On, noise. Sitting in the driveway it would acquire lock, and change to one or two birdies.... No lock, and it covered AT least from 144 MHz to 440 MHz, every 25 kHz !!

I found no frequencies that it made impossible for FM, only weak signal SSB.

173. BETA74i.zip and U-2000

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 8 Feb 1996 16:06:57 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960208155437.6189A-100000@greatlakes>
Rendered body type: text/plain

```
This beta contains fixes for the U-2000 and a new MAPFIX19 program:
This version still does not address SYSTEM lockup due to COM BUFFER
OVERFLOWS, but does address most of the other u-2000 issues:

THIS IS A BETA!  If you dont have a U-2000, there is not much need for
you to get this one...

Here is what I know about the U-2000:

1) It can send out a negative WIND DIRECTION.  Fix is to ignore the
   two high order HEX bytes
2) I fixed APRS to display negative temperatures
3) The U-2000 in PACKET mode only sends one valid wind speed/direction
   and then on it sends out 000's for wind.  This is a U-2000 problem
   if you are going to use the U-2000 in REMOTE stand-alone mode only.
4) Your TNC's must ignore all linefeeds, or APRS will not see the
   WX data.  For a stand-alone-remote, be sure the TNC LFIGNORE is
   turned ON.  For APRS receive and a KPC-3, be sure LFSup is ON.
5) To avoid waiting for 5 minutes for U-2000 packets, alternately
   swtch it between packet mode and modem mode.  Each time it enters
   packet mode, it will send one packet.  (These will always have
   good wind, but after the first 5 minutes any future ones will have
   000's.

CAUTION: MAPFIX key commands are all different!  You will have to break
old habits.  The progarm is MAPFIX19.exe but internally it already thinks
it is 20.  I will call it 19 until I release 20 in a full APRS version.
If you use MAPFIX, give it a work out.  I want to finally make it
robust and user friendly....
```

176. Tiny SHELL COMM program

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 8 Feb 1996 17:28:11 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960208171708.7664D-100000@greatlakes>
Rendered body type: text/plain

My OPS-COMM-TNC dumb terminal mode was only intended as a debugging tool.
I had always hoped that someone would identify a very simple and basic
COMM program that could be run after SHELLing to DOS. Since no one has
identified such a program, maybe it is time to ask again...

Since APRS is so big, it will have to be a small DOS program.. But it
would be very valuable for APRSdos...

With such a program, a user could do a FILES-DOS to shell to DOS, run the
program and use his TNC to conect to another station, do file transfers,
etc, and then when done, EXIT back to APRS...

I use my Magellan with an external antenna (The one that looks like a big Egg)
and it's mounted right in back of my dual band mobile antenna for my Yaesu
FT5100 (I would say maybe 10" apart. I have never noticed any EMI at all. I
use the Yaesu constantly while the GPS is running. I have also many times
run the Magellan inside when setting up a tracker, like just a few minutes ago. It
does take a while to lock on to the birds this way but it always does, but no
EMI on any of the equipment in the shack at all. But then again you all know
the old saying (You only get what you pay for), you cannot expect a $269.00
GPS to perform like a $700 unit, nor a $700 unit like a $14,000 one.

I vote for WA7MBL's YAPP 2.0 (Shareware)

You can build "startup" and "shutdown" scripts in it, it supports scroll
back buffer (and writing this buffer to disk), turn on/off printer logging,
DOS shell (which can be disabled by eliminating a *.com program that
controls this, the name of which escapes me now) and allows ASCII and YAPP
binary up/downloads etc.

It's a DOS program - 50K, plus the few text files.

Drawback: Only COM1 and COM2 (with standard IRQ's) are supported.

Bob i just installed 74i and when zooming in on my qth it crashes and gives
me the message BACK IN PLOTCURLZ then gives a screen full of numbers
like the following 34L2 86L2 etc etc. Then at the bottom OOPS ERROR 14
very repeatable...

Bill KE4EER

Hi Bob,
I am running v74E and I have tested it with a Wx station who is a Mac users.
He was sending both position reports and wx reports.  Depending on how lucky I
was, I would either see a message similiar to the above, or I would get his wx
report.  He turned off his posits, and now I get nothing but wx reports.

(ooppsss, just heard on the radio, that have found the problem)

I will reply in a later note if you need more.

cheers...mike

Bob-

I'll give it a try this weekend, and see if anything crashes.  To do a YAPP
file transfer, it requires pins 1-8 and 20 wired (that's on a 25 pin
connector) and hardware flow control set on... will this cause problems with
APRS/DOS?   Otherwise, I think that software flow control is OK for non YAPP
use - I'll try it both ways.

Mark

194. Digitizing troubles

From: dbbrumm@mtu.edu (Doug Brumm)
Date: Fri, 09 Feb 1996 14:39:34 -0500
To: aprssig@tapr.org
Message-ID: <199602091937.OAA00873@pobox.ee.mtu.edu>
Rendered body type: text/plain

I have a Summagraphics Summa Sketch II Professional model MMII 1812
digitizing tablet and have looked forward to being able to generate maps
with it. All attempts to get MAPFIX (version 1.8) to work with it have been
unsuccessful, however. The tablet, by itself, puts out data in a binary
format incompatible with MAPFIX. I have tried two different Summagraphics
drivers, including one that is supposed to make the tablet look like a
Microsoft mouse, but with only frustration to show for it. These both
produce ASCII data, but in a continuous data stream that quickly crashes
MAPFIX. I have tried both the digitizer and mouse options in MAPFIX, each
with both drivers. Has anyone been successful with a Summagraphics tablet?
If so, how?

Thanks much for any suggestions.

Does anyone perhaps already have a map of Michigan's Upper Peninsula or,
better yet, just the Keweenaw Peninsula?

196. Re: [APRSSIG:6628] Timeout/timer

From: Bob Bruninga <bruninga@nadn.navy.mil> (by way of Robert Abrams <KI6MP@mci.newscorp.com>)
Date: Fri, 9 Feb 1996 15:39:27 -0500 (EST)
To: Aprssig@tapr.org
Message-ID: <199602092039.PAA25976@kafka.delphi.com>
Rendered body type: text/plain

I could, but it violates the philosophy of APRS, and that is that
everyone is monitoring all the time for APRS packets. If you go off line
to pass traffic, then you may miss som very important pacekt. Even worse
is if someone conects to you, and seeing no human response, they leave
you connected, you are effectively OFFLINE until the timeout period. You
would never want to leave yourself so vulnerable to outside events.

The time out is not a problem as long as someone is at both ends, using
the channel to pass tracffic. If someone is NOT at the keayboard
(keeping it busy to avoid the timer) then again, that is NOT when you
want his terminal on the BLUE screen ignoring all APRS traffic.

You will have to give me a complete scenairo and a lot of explaination of
how you see this as a benefit in order to convince me to put such a
potential weakness in APRS, hi hi...

The solution I have always sought, is for someone to find a SMALL and
SIMPLE COMM program that you can SHELL out of APRS, do you COMMS with
normal packet, and then EXIT back to APRS. If you could inspire the
computer hackers out there to help you find such a SMALL COMM program,

then we will all benefit! THanks...

WB4APR REPLY COMMENT:Bob thanks for the response and here is our scenario:

Aprs here in San Diego Co. has over 100 stns on line from time to time.
They are sprinkled throughout the Co. We, in ARES want to take advantage of the
"relay" effect to connect with MBX stns. back in the city of San Diego from
outlying areas where we cannot normally connect on regular packet on other
freqs.

We have worked out a path to get to another freq. from 145.790 utilizing a node
situated on Otay Mt.(elev. 3600 ft).This path gets us to the MBX from which the
local ARES stns can access our emergency traffic.

I like the idea of a comm program we can access from a shell, place the
traffic in a
file, send out the traffic and then back into APRS.

It would still be nice however, to lengthen the timer time to approx. 15
mins or be
adjustable.

Thanks for your consideration and: " keep the faith "

198. PicoPacket Announcement

From: "Gwyn Reedy, W1BEL" <gwyn@paccomm.com>
Date: Fri, 9 Feb 1996 16:36:55 -0500 (EST)
To: aprssig@tapr.org
Cc: File <file@paccomm.com>
Message-ID: <Pine.LNX.3.91.960209162923.30540A-100000@paccomm>
Rendered body type: text/plain

The following is a copy of a letter which will be mailed to each appropriate PicoPacket owner. It is published here since many APRS users use the Pico and are interested in the status.

Please wait for your letter to arrive before acting so that we may keep a scheduled flow running and avoid additional delays. We expect to send about ten letters per work day until everyone is notified.

PicoPacket Warranty Recall Notice

Dear PicoPacket Owner:

This is to notify you of the need to return certain models to the factory for modification. Our policy is to make good equipment and stand behind it. If something is wrong, we will make it right. I apologize for any inconvenience this PicoPacket problem has caused you.

Purpose of Recall

This recall is to eliminate the cause of battery backed memory parameter loss experienced by many units.

Modification Details

This modification will change the operation of the real time clock decoding circuit to eliminate the loss of memory parameters. The power switch on some models will also be modified to eliminate one of the two ON positions. Quickly switching from ON to OFF to ON also contributes to parameter loss.

While the units are at the factory, the latest EPROM version will be installed and any battery pack/cabinet interference problems will be addressed.

Which PicoPacket Models

This recall does not apply to all PicoPackets. It applies only to those units built on circuit board of revision 1.2. The easiest way to identify this revision is to note that it has a power switch on the rear (bottom) while other revision levels do not have a power switch at all. Units without a power switch should not be returned.

Shipping Instructions

1. The following items are attached to this letter:
- Return address label
- PacComm address label
- Priority Mail Label
- $3.00 postage (imprinted). Note: for non-US addresses different arrangements will be made.

2. Place the PicoPacket (and battery pack, if so equipped) in the original PacComm shipping box or other sturdy container. Do not include any cables, manuals, or other accessories. Wrap the PicoPacket in

old newspaper or other padding to prevent damage during shipping.

3. Securely seal the package with tape (never use string), and apply
the return address label, the PacComm address label, the priority
mail label, and the postage. Update the return address if needed.

4. Drop in any US Postal Service mailbox or office.

5. PacComm will modify and test the unit within one or two days.

It will be shipped to the return address on your package by UPS surface
(Parcel post for P.O. Box addresses). You should have the unit back
within 6-10 calendar days, depending on delivery delays.

Please refrain from inquiring about the status of your unit until
at least 14 days have passed since you first sent the unit. We want
to devote our time to modifying the units, not answering inquiries.

Thank you for your cooperation.

Sincerely,

Gwyn Reedy, W1BEL
President

Hello all,

Sorry for the confusion. I just sent the same message I sent a
few days ago re: 6mtrs....

However what I meant to send was a thank you to all of you who replied. It
is good to know that there are some other 6mtr stations out there. Many thanks.

Now on to my next venture. I would like to set up a 6mtr gate here at my
qth. Any comments or suggestions would be most greatful. I think there are
some possibilities with 6mtr and of course will depend on propogation. Even
at that if we had enough digi's within range of each other there are some
good possibilities.

Anyway thanks once again. Take care and all best.

Howdy APRSers...

Those of us in Northeastern PA are awaiting some warmer weather to up to the mountain aand establish an APRS unit on VHF. As for now, and over the course of this weekend, we will be attempting to "make our presence known" to others in NNJ, SNJ, and NLI. Please send a message if you see any of the following calls. WX3A, WM3L, N3SIN, WC3Z, and yours truely, N3KAE. We will try using WX3A as a digi to get to and through KA3ODJ-8. Thanks for reading .

73 de Al, N3KAE... even though the message name states Lorie (my wife)

Bob,

Might I suggest Packom by Jim Wright WB4ZJV. Although the latest date of the program is 1987 it is a full featured packet program with split screen and a lot of extras but still not entirely large. maybe the best would be to put in a shell out command and let the user decide.

WB4APR REPLY COMMENT:

Drivers? All of the tablets I use just have a serial RS-232 output that output serial ascii characters. There are no drivers. You can even look at them with PROCOMM or any dumb terminal program and see the X,Y data. Inside my SUmagrphphics tablet are a bunch of dip switches for setting up all sorts of options. What you want is POINT mode where only one X,Y pair ov values is output each time you press the pen or click the mouse.

Mapfix expects to see the following data at 9600 baud 7 or 8 bits

```
XXXX,YYYY,C  where C is something representing what key is pressed on
             a multip button mouse
OR
XXXX,YYYY  should also work...
```

(I may have the XXX and YY reversed, I cant remember....)

Concerning someone's request to lengthen the OPS-COM-TNC dumb terminal mode timeout timer....

OH, I see...... You are going to connect to a BBS and not another station... I guess that is different. Lemme think...

I could lengthen the timer for a user if HE INITIATES the OCT mode.... But if someone else connects to HIM, I will keep it at 3 minutes (or whatever it is at now...)

```
Sure, you convinced me.  h i hi

BUT, im not sure how well having a BBS on an APRS freq is going to work
out...
  But that is another subject...

I meant for this message to go back to the individual, but I messed up
and lost the return address...  so here it goes to the sig...

WJ8T Comment:

I have the same tablet.. does the same thing BUT I have the
drivers...   I USED to use the Tablet when I was running 3.1 windows
under DOS but I crashed the Drive and installed win95.

I have the drivers on my Computer.. If you can FTP, try 205.243.16.75
under the APRS directory... Get 013.EXE and use the SEND command to
configure the Tablet for the proper format.

Have fun.. Questions?  E-Mail me and I will TRY and answer them..

Hi Doug

I have a Summagraphics II Professional Plus as well. To get it to work you
need the Summagraphics SEND.com program and use the following data:

SEND /1 /S96 /Czaz8c8cFBe

rather cryptic eh!

This sets ASCII mode, 9600 baud, N,8,1

lower left origin
absolute co-ordinates
point mode
resoloution 200lpi

I put it in a simple bat file, so whenever I digitise maps I just do an
'aprsinit'.

Let me know if you need the SEND program

I find the tablets large size a big advantage when doing maps, used to use a
small HP tablet but was always moving the maps around.

211. 32 mile maps

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 10 Feb 1996 13:18:02 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960210130851.28595C-100000@greatlakes>
Rendered body type: text/plain

```
I have been cleaning up my standard MAP distros E, W, M, C, SE maps.
I did a MAPS-HEIRARCHY to see what areas do not have decent coverage at
the 32 mile scale. As a result, I just did the west coast of Oregon and
south alabama.

The problem is that with the hundreds of maps, I can't be sure that
everyone is covered everywhere.  Nor do I want to duplicate maps that
someone else has done.

1)  If anyone lives in an area of APRS activity that does not have one of
the 32 mile (or so) USGS maps that gives roads, rivers, county lines and
administrative boundaries, PLEASE TELL ME.  Give me the LAT/LONG of the
```

needed CENTER.

2) If you are using a 32 mile or larger map that was generated locally
and is NOT in my standard distros, then SEND THEM TO ME. I do not want
maps below this scale, but do want my standard distros to cover everywhere
down to this 32 mile USGS level.

Thanks. P.S. Still waiting for feedback on BETA74i. Only one comment
heard from EER.

Bob- Do you have the 32 mile Georgia maps (GA-1 thru Ga-10) that I made?

and

Did you fix (in 74I) the problem that causes hsp lockup when RMC sentences
are present?

It is repeatable here by 2 diff people and 2 diff computers. Have NOT tried
it on 74i yet. I'm still on this 2 month Florida road trip and can't get to
the GPS to reset the string to RMC from GLL right now. It is buried under a
bunch of junk in the back of the van.

I'll try to do it next week.

From: Bob Bruninga <bruninga@nadn.navy.mil>
Subject: [APRSSIG:6632] Tiny SHELL COMM program

My OPS-COMM-TNC dumb terminal mode was only intended as a debugging tool.
I had always hoped that someone would identify a very simple and basic
COMM program that could be run after SHELLing to DOS.  Since no one has
identified such a program, maybe it is time to ask again...

Since APRS is so big, it will have to be a small DOS program..  But it
would be very valuable for APRSdos...

With such a program, a user could do a FILES-DOS to shell to DOS, run the
program and use his TNC to conect to another station, do file transfers,
etc, and then when done, EXIT back to APRS...

Have you read the txt files that come with the program?
I think the awnsers you are looking for can be found there.

218. TNC DOES NOT RESPOND TO APRS

From: Grampyruss@aol.com
Date: Sat, 10 Feb 1996 18:18:07 -0500
To: aprssig@tapr.org
Message-ID: <960210181805_419466277@emout05.mail.aol.com>

fROM: Russ Hulber KA1VMQ
        5 Robinson Dr., Bedford, MA 01730
        TN (617) 275-9313

E-mail address: Grampyruss@aol.com

I am very much interested in your APRS program and
have a copy of it and have been trying to get it
to work for me but for some reason I can't get the
programs to communicate with my Kantronics KamPlus
TNC. If I can get it to work I would be interested
in getting it registered!

When the question comes up, TNC = AEA, PICO OR TAPR?
should be entered? I have tried both PICO & TAPR and
neither one will work!

There is also a choice involving 2 port Kam and I have
tried it with "K" and without, but will not work.
```

I also went to the O, C, T command and could not get the
TNC to respond.

When in the APRS working mode the xmttr did not repond
to a "ping" and the screen showed no indication of
traffic when traffic was indicated on the transceiver.

If you have any suggestions I would appreciate the same,
in addition to my E-mail address I can be reached at
by home BBS KA1VMQ@KB4N.#EMA.#USA.NOAM, usually the
latter part of that string is not necssary anymore.

Sorry,

I am sorry to have to use the sig again but I received a message from a Greg
? in TO which I deleted instead of replying.

Anyway I am running Aprs on 50.620 fm. How is everyone else running fm or ssb??

Tnks in advance..

Bob- Do you have the 32 mile Georgia maps (GA-1 thru Ga-10) that I made?

and

Did you fix (in 74I) the problem that causes hsp lockup when RMC sentences
are present?

It is repeatable here by 2 diff people and 2 diff computers. Have NOT tried
it on 74i yet. I'm still on this 2 month Florida road trip and can't get to
the GPS to reset the string to RMC from GLL right now. It is buried under a
bunch of junk in the back of the van.

I'll try to do it next week.

Rendered body type: text/plain

From: Bob Bruninga <bruninga@nadn.navy.mil>
Subject: [APRSSIG:6667] 32 mile maps

I have been cleaning up my standard MAP distros E, W, M, C, SE maps. I did a MAPS-HEIRARCHY to see what areas do not have decent coverage at the 32 mile scale. As a result, I just did the west coast of Oregon and south alabama.

The problem is that with the hundreds of maps, I can't be sure that everyone is covered everywhere. Nor do I want to duplicate maps that someone else has done.

1) If anyone lives in an area of APRS activity that does not have one of the 32 mile (or so) USGS maps that gives roads, rivers, county lines and administrative boundaries, PLEASE TELL ME. Give me the LAT/LONG of the needed CENTER.

2) If you are using a 32 mile or larger map that was generated locally and is NOT in my standard distros, then SEND THEM TO ME. I do not want maps below this scale, but do want my standard distros to cover everywhere down to this 32 mile USGS level.

Thanks. P.S. Still waiting for feedback on BETA74i. Only one comment heard from EER.

Subject: [APRSSIG:6671] Tiny SHELL

From: Bob Bruninga <bruninga@nadn.navy.mil>
Subject: [APRSSIG:6632] Tiny SHELL COMM program

My OPS-COMM-TNC dumb terminal mode was only intended as a debugging tool. I had always hoped that someone would identify a very simple and basic COMM program that could be run after SHELLing to DOS. Since no one has identified such a program, maybe it is time to ask again...

Since APRS is so big, it will have to be a small DOS program.. But it would be very valuable for APRSdos...

With such a program, a user could do a FILES-DOS to shell to DOS, run the program and use his TNC to conect to another station, do file transfers, etc, and then when done, EXIT back to APRS...

Wow, I didn't know that...and my computer too. I have been running Yapp 2.0
since it first came out (have tried many other packet pgms, but always come
back to Yapp.). I just did the F-D trick in APRS and went to dos and called
my y.bat for Yapp and it came up and worked as advertised. I connected to
the local bbs and downloaded a couple files and then exited the pgm. I had
to change dir to aprs as my batch file dumps you back to the route dir. Now
for the other thing, I am running Windows 95 on this machine and Yapp works
fine, as it did in Win 3.0, 3.1, and 3.11. I do not run APRS on this box as
that is on a 386 that is dedicated to all of my ham band stuff. This machine
is my number one box and is used for everything else, plus Navy Mars.

Hey folks!

```
Who's the _________________________________ out there that's refiling messages
          (fill in your favorite expletive!)
```

four and five times from PANDA.NET? C'mon, this isn't funny and it's a total waste of time and, not to mention, money for those of us on a tight budget when we have to spend our valuable internet time receiving multiple duplicate messages!

I am certain that neither Bob nor RWF are doing this intentionally! I'm also having a little doubt about Bob having changed his EMail address unexpectedly...The URL looks a LITTLE strange with multiple @'s....

Hope this is just somebody ACTING stupid and really isn't a symptom of things to come!

While I'm at it, it's REALLY annoying to read complete copies of original messages in replies/comments. Can we either completely drop this practice or, AT LEAST, just quote enough to refresh memories.

Something to think about, PLEASE!

Russ..

I have a KAM and the answer to you question is simple.....

Use a text editor and go into the aprs\system\inittapr.tnc file....

The very first line says PAR 0.....Change it to PAR 4 and you will
be in business....

Like the docs say....APRS runs in 8 bit, no parity, one stop bit mode and
will not operate at any other setting.

Oh, btw, make double sure your abaud setting and aprs speed setting are
identical as well...I run mine at 4800 even though I have a 486X33 machine.

73 es good luck

233. APRS Users at Orlando Hamfest ??

From: n2czf@gate.net
Date: Sun, 11 Feb 1996 09:53:56 -0500
To: aprssig@tapr.org
Message-ID: <199602111453.JAA42584@osceola.gate.net>
Rendered body type: text/plain

Just to let anyone attending the Orlando Hamfest know a few APRS users will be
attending on at least Saturday. I have spoken to N4NEQ and WB2GNZ recently and
both are planing to attend including myself.

I personally hope to be there by 9am or so and am planing to leave at 2pm the
latest. I will be runing APRS with a notebook on 145.79 along the Florida
Turnpike to the Fairgrounds via I-4 in Orlando. Power output will be 45W to give
you an idea of a possible range.

At the fairgrounds I will be monitoring 145.79 and 446.00 Simplex. If Orlando is
as RF hostile as the Miami hamfest 446.00 will be the best bet, VHF was trashed
last year in the halls.

I hope that most APRS users attending will be there at some common time on

Saturday. We can all meet on the air and group somewhere on the grounds for a
APRS "Bull Session" or eyeball.

Dear Kevin, KD4UYR:

In a message dated 96-02-11 08:53:31 EST, you write:

>Russ..
>I have a KAM and the answer to you question is simple.....
>Use a text editor and go into the aprs\system\inittapr.tnc file....
>The very first line says PAR 0.....Change it to PAR 4 and you will
>be in business....

>73 es good luck
>de Kevin KD4UYR

Russ stated in his message to the SIG that he is using a KAM PLUS which means that his EPROM does NOT use numbers to designate parity. The KAM PLUS uses words (ODD, EVEN,MARK,SPACE,NONE) instead of numbers for the PAR command. The proper entry in the INITTAPR.TNC file is PAR NONE for the KAM PLUS not PAR 4.

73...Bob
Ponce Inlet, Florida

Ralph I would like to see your maps. I have been working on some covering the central georgia area around macon using data from ftp at usgs. However it was difficult using only a 30 meg HD. So I just installed a new 1 gig HD and now I think I deleted my most up to date maps. Before I start over I would like to see what you already have to avoid duplication of effort. Perhaps we can split the task and do abeter job.

Bob I will send this to the sig due to general interest. When I got home from work I tried the yapp program from the files-dos and it works without any problem. I second the motion it is a good program that works well without a great deal of tinkering.
Computer here is a homebrew 486 dx4-100 1 gig HD vga monitor 4 meg ram using parts from the 286 that died. No sleepy windows yet just dos 6.2
Will send central ga maps unless ralph has already covered the area.

Just my two cents worth and it only cost five bucks in todays mini dollaretts.

Mark,

I removed Yapp from my PC, which is running 95, because no matter what I
tried with 95 properties, I couldn't get Yapp to run.

APRS, conversely, ran perfectly for me on 95 even when I loaded in the beta
Win95 in April of 95.

Yapp would come up and unceremoniously go toes up, black screen, sometimes a
piece of yellow line, nada, dead. I changed every property I could see and
twiddle with, but with no success.

I'm sorry to lose Yapp, and if anybody here is running it successfully,
please post your 95 properties settings. I'd love to get it back.

Tony, WB3KGT

WB4APR REPLY COMMENT:

Sounds like a winner to me.  What is the latest YAPP version, and does
someone need to write a BRIEF YAPP.txt file for me to put in my README's?
Is YAPP shareware?  What does the author want?  Can I include YAPP in my
distro disks?
```

Bob,
Attached is ILCOUNTY.ZIP, with 3 maps of scales 32 mi or greater.

ILNOCNTY.map NO IL County Lines
ILSOCNTY.MAP So IL County Lines
ILLEMONT.MAP A Chicago area map, centered on Lemont IL.

The rest I have made have been 16 mi or less.

To: aprssig@tapr.org
From: rwf <rwf@mindspring.com>
Subject: Georgia 32 mile maps
```

I zipped up the GAMAPS01.ZIP file as requested.

TAPR was down when I tried to FTP, so they are on my site. I'll move them
to TAPR as soon as I can.

my site:

ftp.mindspring.com/users/rwf/aprs

Or via web at   www.mindspring.com/~rwf

Subject: [APRSSIG:6668] Re: 32 mile maps

Bob- Do you have the 32 mile Georgia maps (GA-1 thru Ga-10) that I made?

and

Did you fix (in 74I) the problem that causes hsp lockup when RMC sentences
are present?

It is repeatable here by 2 diff people and 2 diff computers. Have NOT tried
it on 74i yet. I'm still on this 2 month Florida road trip and can't get to
the GPS to reset the string to RMC from GLL right now. It is buried under a
bunch of junk in the back of the van.

I'll try to do it next week.

Subject: [APRSSIG:6685] Where's all these dupes coming from?

Hey folks!

Who's the ________________________________ out there that's refiling messages
(fill in your favorite expletive!)

four and five times from PANDA.NET? C'mon, this isn't funny and it's a total
waste of
time and, not to mention, money for those of us on a tight budget when we have
to
spend our valuable internet time receiving multiple duplicate messages!

I am certain that neither Bob nor RWF are doing this intentionally! I'm also
having a
little doubt about Bob having changed his EMail address unexpectedly...The URL
looks a LITTLE strange with multiple @'s....

Hope this is just somebody ACTING stupid and really isn't a symptom of things
to
come!

While I'm at it, it's REALLY annoying to read complete copies of original
messages
in replies/comments. Can we either completely drop this practice or, AT LEAST,
just quote enough to refresh memories.

Something to think about, PLEASE!

73 de Jim, KU0G

Bob- during the short time I had my remote Ulti II up (before it went whacko), I was running APRS 74C to monitor it. Every beacon overwrote my WX posit.

fROM: Russ Hulber KA1VMQ
        5 Robinson Dr., Bedford, MA 01730
        TN (617) 275-9313

E-mail address: Grampyruss@aol.com

I am very much interested in your APRS program and
have a copy of it and have been trying to get it
to work for me but for some reason I can't get the
programs to communicate with my Kantronics KamPlus
TNC. If I can get it to work I would be interested
in getting it registered!

When the question comes up, TNC = AEA, PICO OR TAPR?
should be entered? I have tried both PICO & TAPR and
neither one will work!

There is also a choice involving 2 port Kam and I have
tried it with "K" and without, but will not work.

I also went to the O, C, T command and could not get the
TNC to respond.

When in the APRS working mode the xmttr did not repond
to a "ping" and the screen showed no indication of
traffic when traffic was indicated on the transceiver.

If you have any suggestions I would appreciate the same,
in addition to my E-mail address I can be reached at
by home BBS KA1VMQ@KB4N.#EMA.#USA.NOAM, usually the
latter part of that string is not necssary anymore.
 73 Russ

WB4APR REPLY COMMENT:

SOUNDS PERFECT.  Have you tried it fropm APRS?  Just do a FILES-DOS and
see if it will run.  Thanks!

Subject: [APRSSIG:6679] 32 mile ma

From: Bob Bruninga <bruninga@nadn.navy.mil>
Subject: [APRSSIG:6667] 32 mile maps

I have been cleaning up my standard MAP distros E, W, M, C, SE maps. I did a MAPS-HEIRARCHY to see what areas do not have decent coverage at the 32 mile scale. As a result, I just did the west coast of Oregon and south alabama.

The problem is that with the hundreds of maps, I can't be sure that everyone is covered everywhere. Nor do I want to duplicate maps that someone else has done.

1) If anyone lives in an area of APRS activity that does not have one of the 32 mile (or so) USGS maps that gives roads, rivers, county lines and administrative boundaries, PLEASE TELL ME. Give me the LAT/LONG of the needed CENTER.

2) If you are using a 32 mile or larger map that was generated locally and is NOT in my standard distros, then SEND THEM TO ME. I do not want maps below this scale, but do want my standard distros to cover everywhere down to this 32 mile USGS level.

Thanks. P.S. Still waiting for feedback on BETA74i. Only one comment heard from EER.

From: Bob Bruninga <bruninga@nadn.navy.mil>
Subject: [APRSSIG:6632] Tiny SHELL COMM program

My OPS-COMM-TNC dumb terminal mode was only intended as a debugging tool.
I had always hoped that someone would identify a very simple and basic
COMM program that could be run after SHELLing to DOS. Since no one has
identified such a program, maybe it is time to ask again...

Since APRS is so big, it will have to be a small DOS program.. But it
would be very valuable for APRSdos...

With such a program, a user could do a FILES-DOS to shell to DOS, run the
program and use his TNC to conect to another station, do file transfers,
etc, and then when done, EXIT back to APRS...

Have you read the txt files that come with the program?
I think the awnsers you are looking for can be found there.
Scott

253. Re: [APRSSIG:6692] Re: Yapp

From: tedant@usa.pipeline.com (Theodore Antanaitis)
Date: Sun, 11 Feb 1996 16:55:21 -0500
To: aprssig@tapr.org
Message-ID: <9602112155.AA29185@pipe8>
Rendered body type: text/plain

Has anyone had success using Yapp with an HSP?

I have not been succesful and have had to replace the HSP with
a serial cable to communicate properly with the THC.

I would be interested in the Yapp configuration file if anyone has
gotten this to work.

Rendered body type: text/plain

Due to a glitch while upgrading the operating system on tapr.org, several
pieces of mail were lost or mangled on the APRSSIG mailing list. These
losses all occured between about 17:45 and 18:20 CST on Sunday, 11 November.

If you submitted mail to the APRSSIG mailing list Sunday afternoon and it did
not get posted correctly, you'll need to resend it. Please accept my
apologies for the error.

255. ult2000 & aprs74i

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Sun, 11 Feb 1996 18:25:42 -0800
To: aprssig@tapr.org
Message-ID: <199602120225.SAA23831@poseidon>
Rendered body type: text/plain

Attn, Bob Bruninga/WB4APR
  APRS VER74e and Ulti2000, locking up keyboard frequently, causing reboot of
program. Apparent collision of data sent at same time. 15 second update from
ult2000 sends, "GETTING WX STATION DATA", at top of screen inbetween range
and times boxes.. Transmits WX data every 9 minutes. Wind dir/spd and temp sent
correctly, but Barometer in error. If 3009in, reports indicates B019 Inches.
Ocassionaly B018", seems to be stuck at 3019, even if actual pressure rises or
drops. Now Ult2000 shows Baro of 3003, is transmiting on air B017...
  Acquired Ver74i, from TAPR last evening, after looking 4 other BBS's, not
having the screen lockups as before, but can lock it up, and time box upper
right will flash "comm buffer overflow" continuously until you break WX data
connection. Returns to normal operation of APRS keyboard. Can then reconnect
Ult2a connection and 15 second updates resume, and ops normal again.
   I lost LOG setting of ULTimeter program, called Peet and they got me back
up and running, via phone conversation. Also advised to contact them in 2 1/2
weeks for new Version & Program update, Bill had talked to you, day before.
I mentioned Baro error, would look into it..
   Any other bugs, will advise. Anyone else on sig have unusual occurances with
Ultim2000 and program ?? Pse advise.
         73's & Enjoy, Bill/WB6LPG (wbliss@coastside.net)

256. APRS PROBLEM NOT SOLVED

From: Grampyruss@aol.com
Date: Sun, 11 Feb 1996 21:45:48 -0500
To: kheyboer@pinegov.co.pine11as.f1.us
Cc: aprssig@tapr.org
Message-ID: <960211214547_319339282@mail04.mail.aol.com>
Rendered body type: text/plain

Hi Kevin, Russ KA1VM here,
Thanks for your come back to my frustration regarding my
inability to make the APRS program function with my
Kamplus TNC. I changed the PAR from 0 to 4 as you recommended,
still can't talk to the TNC in the command setting, after I
go thru all the recommended settings for APRS and arrive at
the point where I do a "Ping" the transmitter does not
respond since there is no communication to it nor do I see
any response on the screen from input from received info
from the transceiver.
My son-in-law is using this program on his KPC3 and has no
problem at all (he can be reached at NO1R@KB4N.#EMA/USA/NA
(U MAY NOT NEED ALL THE GARBAGE AFTER KB4N), he lead me to
the program and has a considerable knowledge of all this
protocol etc. and is very frustrated at this point, can't
understand why we can not communicate with the Kam+ in the
command mode!)
He feels there just has to be some setting when using the
Kam+ that is peculiar (to say the least about the Kam+)
that we haven't been able to discern).

bruning@nadn.navy.mil (Bob Bruninga) replied and suggests
the following:
RE: PICO & TAPR, neither one will work, use T for TAPR
RE: 2 PORT KAM and I have tried it with "K" and without
    but will not work. Use K for KAM.

I also went to the O, C, T command and could not get the TNC
to respond (my experience also).
He asks the follwing questions:
What baud rate Ans. 4800
What other softwares Ans. KaGold, however, when I use APR
I start from DOS, kaGold has not been loaded.
Have you tried PAR none? Ans. Yes, that was the setting before
I change the setting as you recommended.
Have you read trouble.txt Ans. No, I was hoping this would be
an uncomplicated answer that would not tax the tar out of my
limited knowledge (I know when all else fails, read the
instructions but these instructions are not simple for non-

software giants, is there something about the Kam+ that is
different from the usual TNC'S, why does their KPC3 work ok?)

Are you running the KAM+ or the KPC3? If you are running the
Kam+ would you give me all the settings you use stepXstep. Did
you have any problems getting your TNC to respond when you
did the O, C, T command sequence or was it that you din't find
it necssary.

Your help is very much appreciated!

I have a KPC, Ver6 with a KAM factory HSP switch, and A Eagle Accunav sport
GPS. I still can not get it to work.

When APRS comes up I see a message in the upper right "HSP timed out"
and then I see it try to communicate with NMEA and then times out again.

Can anyone tell me what the exact commands that have to be set in the KPC3
to make it work with an Eagle. Also is there anything else I should be doing
to make this work.

Help is needed we have been struggleing with this for two weeks and time is
running out before we start out trip.

Tom

Rendered body type: text/plain

What HSP Switch are you using ??? I do know from expirience that 90% of the HSP
problems are with no voltage going to the HSP adapter. Seems that many laptops
do not have the necessary voltage to power the HSP unit at the serial port which
it expects. I forget which pin it is right now, but I THINK it is pin 5, it has
been 6 months since I lived thru that ordeal.

Don't give up, I got mine to work the night before my 1,200 mile trip. The
pressure was really on for me since I dropped $1,900 2 weeks before on a color
notebook just so I could run APRS on the trip.

    I am gonna make a WAG, based on first reaction to reading this message.

    Your KAM is still in the host mode when you bail out of KAGOLD, and
remains there due to the backup memory. Check the KAM+ manual for the
keyboard sequence to bring the
KAM back to native mode. Keep in mind, if I am correct, the terminal program
will still have to talk to the tnc at the correct baud rate and on the
correct port. Good luck.

Hi Russ

Just a suggestion but you need to put the KAM into EXPERT mode before aprs
can be used. Can't remembr the command at the moment but its in the book.

Hope this helps

Bill wanted to know if anyone else on the sig was having unusual occurances with the U-2000 and the APRS program.

I have a U-2000 with an AEA 232MBX and the output from the U-2000 seems to be okay but I'm just getting the "raw" data on the APRS screen and not the processed weather information. My output looks similar to this example:

```
                $ULTW00000000008F000027DE0002CEBA0001036601670447
```

Others have had this same problem and I think Bob is still working on it at this time, so will wait for a corrected version to be developed.

WB4APR REPLY COMMENT:  If you are in HSP, and running APRS, then there are
NO commands in the TNC that need any special settings except for INTFACE
TERMINAL.  In HSP, the GPS does NOT talk to the TNC, but to APRS.  If you
are making a stand alone tracker, then read the TNC version 6.0 detailed
instructions for setting up the TNC to talk to the GPS...

269. OS2 / WinAPRS?

Rendered body type: text/plain

```
Has anyone tested or gotten WINAPRS beta to work on OS2?  I
have not been able to.

Has anyone successfully PKZIPPED and PKUNZIPPED the
OLE32S13.EXE file that is needed to run WINAPRS on a
Windows 3.1x machine?  The .exe file downloads OK at 14.4
in about 90 minutes from ncsa.uiuc.edu but is 3,072,788
bytes long and therefore will not fit on a 1.4 MB floppy.
I downloaded it on my OS2 computer that is used for
internet connections and now need to copy it to my APRS
system which is Windows 3.11.  My internet computer is
running OS2, warped, so even transferring the file to
another computer running Windows using Laplink or
equivalent running under DOS usually does not work!  We
have not yet bought the EXPENSIVE OS2 equivalent of Laplink
```

here at work.

Suggestions?

Before you even ask, the only reason I am running warped OS2 is that one Building Automation System application we use at work ONLY runs under OS2 Warp. Therefore, my internet access is OS2 wether I like it or not if I do not want to pay the premium at home to use Prodigy! Let's see, a 90 minute file transfer using Prodigy would cost? And then I still have to get the file from the "office" machine to the notebook!

270. APRS INterview with BOb and Daytin

From: Greg Jones <wd5ivd@tapr.org>
Date: Mon, 12 Feb 1996 17:07:18 -0600 (CST)
To: aprssig@tapr.org (APRS SIG)
Message-ID: <199602122307.RAA07786@tapr.org>
Rendered body type: text/plain

Hi APRS SIG.

Wanted to update you on a few things.

1. We have added the Ham Radio and More Show from 1/21/96 which featured Bob Bruninga, WB4APR, Author of APRS, on the TAPR Amateur Audio Page. Ham Radio and More is an hour long interview program hosted once a week. TAPR is making selected talks available via our RealAudio Server.

Note that we only have 5 connections enabled currently, due to the potential impact on our current Internet link.

Check out the other two radio news pages we are now supporting with RealAudio as well.

2. We should be announcing shortly TAPR's plan for Dayton. Expect to see one or two hours of APRS during the TAPR Digital Forum. The Sprouls will be at the TAPR booth this year -- and as has been announced by them -- they expect to have the Windows version of APRS ready for release. Plus TN-95, DAS, and other new kits and publications! Lots to look at this year at the TAPR booth! The Friday PackBash will be in a much larger facility -- which should really improve things. We will not run our of space for dinner and have rooms available for SIG meetings and the like. I think there should be a APRS SIG Meeting then -- but haven't discussed it in detail yet with Keith.

Anyway -- that all for now. Just wanted to drop these notes off.

The SIG looks good. Keep up the good work.

Cheers - Greg, WD5IVD
Pres TAPR

271. Exiting Kantronics Host or GPS Mode

From: mwalker@interlog.com (Mike Walker)
Date: Mon, 12 Feb 96 18:08:33 EST
To: aprssig@tapr.org
Message-ID: <199602122308.SAA19888@gold.interlog.com>
Rendered body type: text/plain

I have added the following string to the tapr.tnc file in the system subdirectory. It helps to make sure that your Kantronics tnc comes up in command mode in case it was in Host or GPS mode.

□Q□

will exit the mode.

You can make the □ characters by holding down the ALT key on you keyboard, making sure the numlock is on and pressing 192 while the ALT key is held down.

It is described in all the Kantronics manuals as exiting host mode.

(If you want, you could cut and paste the above in a file), or just make sure
you have a file somewhere on your PC call something like reset.tnc and make
sure the □Q□ is the first line. Then send it to the TNC with any
communications program.

Good luck...mike

Art,
I was able to move it around by using pkzip and having it span disks. Check
the help file. I couldn't get it to run under win/os2, but it did work in
windows. An old fashion dos backup will also work, with a couple of disks.
How about booting dos on the Warped machine and using laplink? You should also
be able to run laplink in a Dos Box under Warp. I didn't have any problem when
I was using it.

Good luck...mike

Bob, I've some maps for Texas that I've been playing with but nothing real
great to speak of. A lot of mine are refinements of existing maps based on
GPS tracks and subsequent corrections.

I'll try to get them updated and sent off over the next couple of days.

My radio is still at MFJ.  They have had it for over a month.  Jim Shurdin
at MFJ told me at first that they had to send it to the designer of the radio.
This was done so I was told.  I called back a couple of weeks later & he
said they had a batch of bad crystals for 145.79, which was what I suggested
the problem could be, before reluctently sending it to them.  I am still
waiting for the radio, Jim said they would put a new crystal from their
Vendor, Standard Crystal Co., whoever they might be, and be sure it was on
frequency.  Will report to the SIG how I come out.

Just a quick post to ask the following questions about the Magellan
Trailblazer XL.

1  Will it work with APRS?

2  What is the output of the data port? IE pin out.

3  Can the existing antenna be remoted about 3-6 feet without needing an
   external amplified antenna?

4  Is there a site on the Internet that has more information on the
   Magellan?

Please reply to <KC4ZGQ@AOL>  or  <JKHAM@DELPHI.COM>  rather than the
sig unless your reply is of interest to all.

WB4APR REPLY COMMENT:  Well, I have been purposefully silent, hihi..  I
bought 5 of them and immediately put one on a tower 75 miles away in th
emiddle of winter.  It now sounds sick.  But its my own fault for not
putting in a heater and thermostat to keep the thing at a somewhat
constant temperature.  But, until I drive 150 miles round trip, i wont
know what is wrong, so do not feel like I should hammer it yet.

A second one is in my den.  It works fine, but I dont like the way its
transmitter sounds by ear.  But I cant complain until I at least make an
attempt to tune it up..

So in my case, they appear just fine, and the price was right, but the
jury is still out as to whether they are really on frequency...

Jon- you're "sorta right and sorta wrong"

KD6KQ-3 is not really "new" in that it's been up since around August, but on 145.010. This exists as a link from the Northern Calif APRS activity on that channel and primarily serves the high desert, which is shielded from the LA basin. Several Bay Area stations digipeat via this system down through the San Joaquin valley and into the high desert (Apple Valley through Lancaster/Palmdale to the Tehachapi's is covered) and Inyo-Kern county (Ridgecrest) of Southern California using about 3-4 digi hops, averaging 100 miles/hop. This has caused a number of the stations in the High Desert and the San Joaquin valley to set-up and get interested in APRS (it's very boring when you - and maybe your buddy- are the only ones on APRS!).

This last weekend, I decided to check out APRS activity on 145.790 MHz, as in the past, there was very little of this activity on this channel (for the out-of-towners, most of the APRS activity in the Los Angeles basin is on the full duplex repeater, 146.745 MHz), and was surprised to see all of the basin activity on .790 - including a whole bunch of stations down in San Diego! So, that's why it may have been the first time you had seen it. If you look at the PHG circles, you can see the effect of the offset gain due to the shading due to the local terrain.

Unfortunately, KD6KQ-3 is on the north side of the mountains, (but still near the top) so coverage into the LA basin is "spotty". It returned to 145.010 late Sunday morning .

Hope it didn't cause too much confusion!

Mark
KD6KQ

1. I used Pcopy (a dos utility that copies large files
across floppies and combines them on the other end). It is
shareware available on many bbs's.

2. You are downloading the wrong file if you want to run
it on a Win-OS/2 machine. The latest Win-32s code that WILL
run under Win-OS/2 is beta version 1.25. Do not...I repeat,
DO NOT even try to run version 1.30 of Win32s under OS/2.
It is very well established that it will not work, and you
will just waste your time.

If you are running OS/2 for windows and have a full version
of windows available and then boot to dos (not a dos window) then 1.30
would work, but not inside OS/2.

I run Warp Connect on two machines and follow the fido net
backbone of most os/2 echoes and this topic has been discussed to death.
You can't get there from here with Win32s 1.30. Since I have another
machine, I put Win95 on it and am running Win APRS on it without
difficulty. The Ultimeter U-2000 works  perfectly with the WinAPRS code,
something I have been unable to do with ANY version of dos APRS. Bob is
working on the  problem, but it is giving him fits.

Hope this helps you figure out what to do. 73,

The question remains, will WinAPRS run under Win32s 1.25 beta? My guess
is yes.

Use PKZIP and zip it to multiple diskettes.  The help screen on PKZIP will show you how.

I'm surprised that WinAPRS won't run in a Win/OS2 session.  Warp is usually easier to get a Windows
program running in than Win 3.1,

Good luck...jn

285. Re: [APRSSIG:6693] Re: Tiny SHELL COMM program

From: jleonard@tbcnet.com (John B. Leonard)
Date: Tue, 13 Feb 1996 10:11:35 -0600
To: aprssig@tapr.org
Message-ID: <199602131611.KAA27746@tbc2.tbcnet.com>
Rendered body type: text/plain

Here's what's worked for me re: Shell Comm and YAPP:

1. I couldn't get APRS File-Dos to work no matter what I did. It (Win95)
kept telling me it either couldn't find COMMAND, or didn't have enuf memory.
(Thanks for your help, Jim)

2. Rather than mess with it further, I knew APRS behaved itself as
minimized, although I suspect it suspends operation while minimized.

3. I used that feature to allow me to start YAPP.exe from a desktop
shortcut, just as I configured APRS74e.exe the same way. So, when within
APRS, I hit ALT-ESC, which minimizes the APRS program, and then start YAPP
from the desktop. It works flawlessly, (used it to con to the local BBS)
and when I'm through, exit YAPP normally (ALT-X, Y for yes), return to the
desktop, and restart, or maximize to full screen, the APRS program which is
on the taskbar. A word of caution! YAPP.CFG may send your TNC shut-down
commands which won't work with APRS, like MON OFF, which is the default.
You may wish to change them. Also, make sure the COMM and BAUD rate in
YAPP.CFG are the same as with APRS.

5. The only problem I've seen so far is while APRS is minimized, some
callsigns get "scrambled". The thing I've done for that is simply DELETE
them from the P-list, and wait for their re-transmission.

ps.- I caused myself all kinds of problems by trying to get DOS programs to
work with 95 until I call M/S and asked them what I was doing wrong. The
person I talked to suggested that 90% of DOS programs will run OK if one
goes to EXPLORER, click on the file that starts the DOS program
(APRS74E.EXE), go to FILE, Create Shortcut, then move it (the Shortcut just
created) to the Desktop. He could have told me to read the manual, but he
didn't. Starting DOS programs from the Desktop has worked very well (not
perfect, mind you).

Bob i'm surprized i don't see a GPS standalone tracker icon for a simple
PICKUP. I see them for firetrucks 18 wheelers, Jeep, etc. How about making
one available for us folks down south here (Like a pickup with maybe a gun
rack in the back window), (Or beer cans in the back at least)!!!

RE: Pickup ICON versus Bus ICON.
Well, I guess not many of us drive busses, but busses are often used in the
larger public service events. We regularly use three or four busses to
transport runners who drop out of the Dallas White Rock Marathon, and have
seen as many as 20 - 25 busses used in the WalkAmerica event when all the
participates were requested to park remotely from the event and were bussed
to the walk site - (also around White Rock Lake). Just FYI.

Rendered body type: text/plain

Real work (and Cows In Space) have stopped me from experimenting with OS/2 implementation of WinAPRS. I asked, but never got a reply as to which Win32s module the Bros. SProul crafted WinAPRS to, so it's gonna be trial and error.

OS/2 has a 32 bit Windows implementation built in, if you're using Warp or Warp Connect. It's not the latest. There are varying opinions as to whether one can shim and trim the later versions of Win32s into place in OS/2... but I guess I'll have to experiment now.

Regards, Gerry

Forgot to mention: If you can boot the machine in DOS (not a DOS window or DOS full screen session) and do a LapLink Clone, it'll work under OS/2 from there. Attempting to clone LapLink, or WinLink, in OS/2 fails because the *Link packages are not typical polite programs.

292. 4WD off-road APRS

From: jan@archimedes.vislab.navy.mil (Jan A. Barglowski)
Date: Tue, 13 Feb 1996 11:55:37 -0800
To: aprssig@tapr.org
Message-ID: <v01520d02ad45eefaa0a2@[129.131.31.10]>
Rendered body type: text/plain

This last weekend I had the opportunity to experiment with APRS during a Land Rover off-road trip to the New Idria (Coalinga), CA area. The following contains my impressions of using this versatile program in an often-harse environment.

My setup consisted of a Toshiba TS2200 laptop, a Kantronics KPC-3 TNC, Yeasu FT-530 radio, Motorola PVT-6 GPS unit, and AC adapter with Triplite power inverter. The inverter was bought at the last minute due to the dubious charge levels of the three laptop batteries. I used the AEA APRS serial adapter so that I could run HSP mode with both the TNC and GPS input through my single serial port. I ran the KPC-3 with the internal 9VDC battery.

During our 5 hour drive to the off-road site, the TNC and radio were kept off and the GPS monitored. This gave a change to play with APRS and see how the GPS position updates were saved and kept the map centered on our vehicle. It was interesting to see the difference between the vehicle and the road we travelled on, which was minimal at the map's 64 mile radius but augmented at a zoom of 4 miles. The AEA serial cable performed very well, and I retrieved both RMC and GGA strings from the GPS.

Previous to the trip, I had prepared 8, 4, and 2 mile radius maps of the area we were expecting to travel in. Using the USGS DLG data from the CDROM and my own map generation program (MapEdit), I was able to create the following maps with under 3000 points:
- 8 miles with highways and secondary roads.
- 4 miles with the above plus class 4 roads (streets)
- 2 miles with the above plus streams and 4WD/trails

This area is rural, so the density of the maps was not very high. These maps did very well in the places they covered, but they didn't cover one area where we drove thru 50ft. visibility fog and looking for an important turnoff! I experimented when creating the maps and expanded the resolution from 640x350 to 2048x1024. This made for much smoother creeks and twisty roads when under extreme zoom-in of 0.25 miles.

For the actual off-road driving, I kept the laptop on my lap. On rough roads I often closed the lid in order to hang on to it better. The display was grayscale VGA, and was readable in directly sunlight as well as at night. During the entire time, I was able to track our progress on the digital map and once even used it to verify our position on our leader's USGS paper map. It was only moderately helpful while navagating due to the dated (1979) data the digital maps were created with.

One experiment I tried was putting a stand-alone tracker on another Rover to watch the update of his position on my screen. The tracker consisted of a AEA PK-12 TNC, an Icom 2-AT radio, another PVT-6 GPS unit, and a 12VDC 2amp/hour battery. I did receive a few transmissions from the tracker, but then abruptly stopped. Seems the 12VDC battery with it's cigarette lighter plug did not hold very tightly and the bouncing from the Rover jarred it loose. The other interesting item was putting the tracker and it's mag-mount antenna on the Rover -- Land Rovers have aluminum body panels! So I improvised and put the tracker and the antenna inside the hood-mounted spare tire, which is steel. For the time the tracker transmitted, it was pretty interesting to watch how the convoy of Rovers spread out and bunched up as we moved along.

Once I turned on the laptop's TNC and radio, I was amazed to find all sorts of APRS traffic appearing on my screen on 145.01MHz. We were travelling at fairly high altitude in the Western side of the San Joaquin Valley, and must have been near a major digipeater. I must've gotten a screen and a half of position updates, from Chico to Bakersfield and even WA6MTZ from Newberry Springs! I tried to ping whatever digis I saw, but I was unable to raise anyone. It sure made an interesting California map!

APRS made an interesting addtion to our paper maps, and enabled the GPS to show something other than lat/lon. The driver I went with now wants to become a ham and install some of this eqipment in his Rover!

As a last comment, I agree with Bob's warning on the opening screen of APRS: "Not to be used for Navigation". While APRS shows a pretty picture, you are very likely to go somewhere that you won't have the detailed maps for, and there is no substitute for an up-to-date paper map.

Hi Doug (kc7co)
Since you are not at your home QTH I will answer via the sig.
The Phoenix group uses 145.79 mhz for APRS.
you can down load phx maps from 938-7528 APRS BBS.(Phoenix number)
I will be sure to check the BBS and if the maps are not there I will insert
them for you.

Zip the .exe file with PKZIP using the disk spanning option. This will put
it on 2 disks. Then put the last disk in the Win machine and extract the
file to a TEMP directory using the -d (directory info) switch. It will ask
for the first disk and then will make a disk 1 and disk 2 directory off the
Temp directory. Close any open programs and run the setup.exe in the disk 1

```
directory.

299. APRS75 and MAPFIX20!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 13 Feb 1996 16:16:59 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960213161147.29688F-100000@greatlakes>
Rendered body type: text/plain

```
A culmination of lots of diddling...
* Both programs now have the proper 3/4 aspect ratio for map borders
* New MAPFIX20 has APRS type menus instead of ctrl-alt keys
* Railroads are now bright white.  Toggle them dark with MAPS-FEATURES-*
* Better Error trap.  It doesnt dump you to DOS! (To force an error,
  stay in the USA maps and zoom below 8 miles on Montreal.. That
  map needs to be re-sized to stay within the nominal recommended values)
Ver 74i:
* Fixed WXsyms so that the alternate NWS WX syms would work again
* Fixed negative temperatures from the U-2000 just in time for spring
* Fixed CRASH on U-2000 negative wind direction
* Fixed remoteWX posits from overwriting WX data
* Still havent fixed U-2000 lockups with 16550 UART FIFO's.  Not that
  I dont know how, it is just a total re-write of my drivers...
* Fixed bug that prevented AEA TNC's from seeing 9 character calls
* Added more filtering for non-aprs (NetRom) packets to prevent crashes
* MAJOR re-arrangement of USA maps so that fewer maps are in USA distro
  and moved them to regional E, SE, M, C, W map distributions.
Ver 74h:
* Fixed problems observed during the Space Shuttle SPRE mission
* Fixed OPS-FIND-[gridsquare command that did not work for E hemisphere
* Made it so that a * had to be seen in the DIGI field for CONGRATS.
  Many TNC's echo their own packets and gave false CONGRATS!
* Fixed it so that dual ports with unproto paths xxx/yyy would work
  properly with the SPACE mode to auto reset timers on hearing the DIGI
```

```
>145.010...This exists as a link from the Northern Calif APRS activity on
>that channel and primarily serves the high desert, which is shielded from
>the LA basin.

Mark -

OK...let me get this right...you have an APRS digi on 145.010 which covers the
High Desert? This is of interest as I am prepping for a St. Louis-to-SFO car
trip, and if everything goes together right it will be an APRS event. (I'll
"announce" once I verify that it all works!)

Coming in I-40/US66, where should I expect to start getting into the digi
system? Should I run RELAY,WIDE or RELAY,WIDE,WIDE or what? Figuring on running
145.790 for most of the trip until getting to California, I mostly need to know
where to change frequencies. We won't be getting below the San Gabriels, so
there will be no concern about the 146.745 repeater.

The system on .010 sounds pretty comprehensive. My Calif. route over about a
week is expected to be Needles, Barstow, Cajon, Lancaster, Mojave, Tehachapi,
```

Bakersfield, Paso Robles, Stockton, SFO, and then out via I-80. Are there any significant gaps to be aware of, and is the entire route on 145.010?

301. DOS MAP STANDARDS

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 13 Feb 1996 16:30:13 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960213161704.29688G-100000@greatlakes>
Rendered body type: text/plain

APRSdos maps were originally intended to have x,y values between 0 and 999 (for brevity). THen last year I made limits of 1024 and 2048 so that I could compress the maps by over 50% in disk space and loading speed. But these limits are only REQUIRED if you plan to save the map in the COMPRESSED format (most are not)..

BUT THERE IS ANOTHER REASON why you should keep close to these values, and that is that I assume those limits when doing a crash check before plotting each point to avoid an overflow error when ZOOMING. Maps that do not stay within those ranges may crash on intense zooming. The MONTREAL map is such a map. Zoom below 8 miles and crashola.

It is easy to see if a map is not conforming to these limits. Just load it in MAPFIX. All of its points should be within the 1024 by 2048 yellow box. A little spillover is not going to crash, but if 50% or 99% of your map is outside of this yellow box, then it should be re-scaled to fit.

ALL MAPMAKERS: Please review your maps and re-origin or re-ppd them to get close to these limits. ANother reason for doing this is that it allows us to make some better assumptions about map coverage between WinAPRS and APRSdos. If you see any of my maps that need fixing. PLEASE report them to me... Thanks!

306. FINAL CALL 20 or 17 Meter APRS??

From: KD4EMI@aol.com
Date: Tue, 13 Feb 1996 18:46:00 -0500
To: aprssig@tapr.org
Message-ID: <960213184559_143405948@mail02.mail.aol.com>
Rendered body type: text/plain

Ok guys, last call...

Is ANYONE operating on other that 30 meters HF..?

IS anyone interested in 20 meters of 17 meters?

Looking especially for Europe stations...?

Send the freq youd like to try and Im there !

FYI   Here is some info you guys might like to know about.
I live in an apt that allows me to have several antennas on the balcony.

I finally broke down and purchased a MFJ loop antenna (10-30MHZ)
I had heard good and bad.   Well my antenna is at 30 feet and
Ive worked a ton of new stations. I works great. Worked Croatia on RTTY,
and almost every state on APRS direct... Lots of new stations every day.
IT's not too good for local stuff, but its a real dx magnet.. (My buddies
with the beams cant believe it !)

```
I highly recomend this antenna and if anyone has specific questions, please
direct it to me personally..

73 MIke
KD4EMI@AOL.COM

308. EXE75.zip

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 13 Feb 1996 19:17:14 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960213190722.2725A-100000@greatlakes>
Rendered body type: text/plain

```
The complete version 75 upgrade file is in 72cto75.zip and is over 900K
long.  The latest APRS75.zip is only 1040K.  But the Upgrade file has
additinal maps that are not in the basic APRS75.zip.  So you should get
the upgrade file..

But for those who just want to test the new EXE without all the other
upgraded baggage, I just posted EXE75.zip which only has the new EXE and
the new MAPFIX20.

I also uploaded my updated regional map distro packages:
Emaps09.zip has some new Maine maps
Mmaps04.zip has new maps of WImadison, WItrego, MIuppercentral,
Cmaps09.zip has COnwest and COswest, fixed TXBexar...
Wmaps07.zip has lots of new Oregon, plus WAYakima, IDBoise
SEmaps09.zip has better south ALA and Georgia Plus NCwin-grn

If you get the 72cto75.zip, ALL OF THESE NEW MAPS ARE INCLUDED
```

>>Windows 3.1x machine?

>Jim Neely
>jneely@eden.com        WA5LHS@tapr.org
```

```
The problem is the version of win32s for win3.1. Only versions 1.15 and
1.25 beta work with OS/2's version of Win-OS2. Version 1.30 (the latest)
will NOT work, period.

If WinAPRS will run under version 1.15 or 1.25 of win32s, then all is
well, just get the right version. If not, Win 3.1 will have to be run in
its native mode (not under os/2) and then version 1.30 will
work...although you will have completely given up on OS/2 at that point.

I run two machines with OS/2 Warp Connect and love it. BUT,
for WinAPRS, I configured a third machine under Win95 and it works
perfectly. 73,

Got a null modem cable? You probably have comm programs on both machines.
Windows Terminal and OS/2 PM Terminal should give you the basic tools.
Just hook them together with the serial ports and initiate a file
transfer using xmodem, zmodem, etc.

Long before we had LapLink, we had XModem and XModem was King.

Is there anyone else that is having a lot of problems with APRS75. Boy i sure
am. First it would not install because it could not find the map directory  so i
did a APRS75/NEW and it installed just fine except it crashed due to not
enough memory. So i figured i would boot from a system floppy to complete
the the whole setup, that worked and didn't need to boot with the floppy
after that but now when zoomed into our local 32 mile map it crashes when
i just ove the cursor with the arrow keys no mather what direction i go. When
it crashes i get an ERROR 14 with a screenfull of numbers, almost the exact
same thing i got with version 74i. No problem at all with 74e....

Hi SIG,
I am looking for someone who likes making maps.
I have one goal in life besides becoming a grandfather,
-and I haven't been doing to well at that-and that is bringing
aprs to the intire free world,and maby beond.
I'm half owner of kb6jc-3 digi on donner summit which connects
the Lake Tahoe area to the rest of Ca.
My partner kb6jc and I have two more digi's doing up in the next
week or two to beef up marginal coverage of the Lake Tahoe area.
One of which will be on the east slope of the sierras
IT WILL SEE RENO.
I hope to have at least ten people chomping at the aprs bit
by the time the digi's go on line.
Also the TARA club in south Lake Tahoe has asked me to
give them an APRS demo at their next meeting-I think they have 150 members-
When I zoom below 8 mi.at s.Lake Tahoe I crash.
I'm useing camaps06.I need maps for South Lake Tahoe,Reno,Carson City and
Fallon for now if anyone would like to help out please let me know
I can always ask Ken w7kke he has been very generous with his tallent
in the past.Thanks Scott

Howdy,

I've been on this SIG and have seen alot of discontent regarding the
MFJ Data Radio for APRS applications.  I've talked with a few Packet
network gurus in my area and they have suggested the Tekk radios
offered through Paccomm.  Well a few questions...

Is anyone using the Tekk for an APRS digi ?

Do they align well for 145.79 ?

Is Paccomm really on-line ?  I keep getting a DNS error ?

Tnx for reading...

Gerry:

Unfortunately the Compaq AERO running OS@ Warped  will not
boot in DOS from the PCMCIA card A Drive!

Also, the OS2 backup program appears to be not compatable
with the DOS program.  I have not tried the CPS backup
program yet to see if I can copy the file that way.

There is a OS2 equivalent of LapLink that will transfer
files and programs to and from DOS and Windows, but it
costs $495 so we have not been able to justify it.

The joys of working with OS2!

Interesting.  I'll have to ask a friend in Austin who claims no problem with
this!  I'll let you know.

> Also, the OS2 backup program appears to be not compatable
> with the DOS program.  I have not tried the CPS backup
> program yet to see if I can copy the file that way.

True, and never advertised to be.  OS/2 backup and DOS backup are different
programs, formats, etc.  Lots more OS/2 has to plan on keeping track of,
especially with EAs and long file names.

> There is a OS2 equivalent of LapLink that will transfer
> files and programs to and from DOS and Windows, but it
> costs $495 so we have not been able to justify it.

When I bought the Aero, it came with WinLink.  I DOS-booted the sucker, cloned
WinLink to the C drive, and rebooted to OS/2 and it's run ever since.

> The joys of working with OS2!

Well, actually, I *do* prefer it to a half-baked monitor advertised as an
operating system and wrapped in a poorly done GUI... or such is still my
opinion of Win9x.  The thing that nails most folks is that OS/2 is an
operating system and as such is somewhat more complex and has more inherent
opportuinities for FUBAR than DOS or windows.  But these things are inherent
in the power of an OS.

Mark and Ken -

Many thanks to you both for the lowdown on California APRS. I will pop over to
the FTP site in a couple of moments here and grab the California maps.
Incidentally, there are some extremely detailed maps of the Bay Area for the
Mac and Win versions. When SA gets turned off they will *really* be useful!

Seeing the two votes for "WIDE,WIDE" certainly addresses that issue! This
shouldn't be a problem as I plan to run 50W on the APRS rig, provided that it
doesn't give headaches with other equipment in the car. The new PicoPacket
(hopefully with the bugs fixed) will be arriving in the next day or so, so
there are testing and configuration issues to solve. I'll be running the HP on
this trip for a PC, but might take it offline now and then for other chores,
and then just beacon position.

Thanks for the warnings, Mark; however, I lived out there for my first 27 years
and am all too familiar with the tule fogs (and the chain collisions on US99).
And, Ken, my mother-in-law lives up on the hill in Belmont, so I guess I can
sit on her balcony and rain RF on you. ;-)

```
Well Bob did some real testing this morning and found that it MUST be a
memory problem only because when booting from a system disk i couldn't get
it to crash (So far). And yes it does recover from the ERR 14.

I got the following screen upon moving the cursor,

LM,PM:8    -1
A$:P
C$:
ES$
Back in Plot Curlz 34LZ 86LZ (etc etc)
OOPS! ERR 14

Hitting enter scrolled the screen twice then when i hit the space bar
it recovered and went back to the map, but when at the 128 mile
level when i moved cursor it crashed again with the above error screen.

It looks like i'm bordering running low on memory with to many TSR's and this
is what may be causing this problem altough i never had this problem untill
74i and 75....

WB4APR REPLY COMMENT: ***** CONCERNING APRS75 and ALL MAPS *****

Everyone may have to change old habits. I moved LOTS of maps out of MAPLIST.USA and moved them into the regional distros. To see the boundaries of Eas, Mid, Cen, Wes, SEast, go to whole USA and hit MAPS-ALT. Here are some additional notes about COLORADO:

* Colorado is in MAPLIST.cen not .wes
* I left off the .map in the MAPLIST.cen list for COswest. so this needs to be edited to add the .map.
* LAST NIGHT I began new 32 mile maps for Denver and Pueblo. Was going to post them today, but noticed that COL SPRS is right on the edge between both so I want to re-do them to overlap better. Will be done by tomorrow, thursday..

Hi Bob and all others

I downloaded version 75 from TAPR via FTP this morning and unzipped it and it ran just fine. I only spent about 10 minutes playing with it, but it ran fine until I had to leave for work. I have left it up and running.

I run is under an os/2 dos box 24 hours a day, 7 days a week.

cheers...mike

329. Does 74e need a math co-processor to run?

From: Greg Blair <siggraph@dgp.toronto.edu>
Date: Wed, 14 Feb 1996 12:10:18 -0500
To: aprssig@tapr.org

Does APRS74e need a math co-processor?

I am attempting to codger together a dual 1.2MB floppy based AT 286-12 APRS system entirely out of junk box components.

(appliance operators forgive me, you won't understand this).

While everything works fine running from a floppy on a 486DX-66, running on the no math co-processor 286 aborts with an "oops error 6" message.

Do I need to scrounge a math co-processor for APRS74E to run?

I do have a 80287-3 which runs away too hot for my liking in the 12MHz AT. I guess I could take a page from INTEL's approach to hot chips: put a fan on it.

If I recall, the 287 runs at 1/2 the 286 clock speed. My 287-3 is rated at 3MHz while the 286-12 drives it at 6MHz.

WB4APR REPLY COMMENT: NO. #6 is an overflow error. COuld be caused by
math problems, but most likely is a missing MAPLIST file or the FIRST map
you are trying to load. On a Floppy, the CONFIG file moved with you from
one machine to the other. It may be trying to load a MAP that you were
ZOOMED into on the other machine, but which is NOT present on the 2nd
machine.

337. APRS time-syncing is Important

From: G. Robert Merchant <hi010@cleveland.Freenet.Edu>

Hi Bob, we used APRS in a Cleveland road rallye last weekend. All APRS
mobiles contributed their log files to a central pool..for me to
compile. The PROBLEM: one station was running EST, another was running
UTC. Some clocks were off by three to 15 minutes... What a mess!

APR REPLY: Everyone should use the alt-SETUP-GPS-TIMEsync command
during any special event. BUT SINCE this is an ongoing problem,
I will discuss with Sproul Bros an ON-AIR command so that one station can
force a time-sync to GPS of all stations on frequency...

APR REPLY: RESTART from scratch with APRS75/new. Your new 75 is using
your old config file which apparently is pointing to a MAP which is NO
LONGER in the MAPLIST.USA. or whatever is your CONFIG'ed MAPLIST.

If you dont want to re-enter all of you CONFIG stuff, then edit your
CONFIG file to use MAPLIST.USA, and a range of 1024 to force it to
load a map that it can find...

Just wanted to say what a novel and sane idea your solution is; will you
limit that time sync by range so only APRS sites that are direct or in a
certain radius get set; so as to eliminate any time lag due to multiple hop's?

MacAPRS (and hence WinAPRS, but it isn't implemented yet) has had the ability
to set the clock to the LOCAL GPS time..

This has been in MacAPRS since the first release....

The problem is that when you go out over the air, and the packet gets
repeated several times, it can be MANY seconds later...

In the situation in the Cleveland road rally, the desire would be to assign
a SINGLE station as the 'TIME KEEPER', and have it send out a TIME SYNC
packet, and everyone that was hearing that AND THAT WANTED TO, could sync
onto that time..

In actuality, this is very easy to do, the question is IS THIS WHAT IS
WANTED?

```
I would like to hear some comments pro and con...

My comments:

PRO:    For the 'special event' situation, this would be a GREAT idea.

CON:    I don't want MY clock goofed up by what time YOU think it is...

Let me know what you think.....

Just to drop a little experience into the hat...

I've been using the Tekk KS-900 (silver box, larger) radios for about a year
on the Cows In Space project with only one apparent failure, and that looks
like a dead crystal.

The radios are pretty rugged and work well in environmental extremes.  I don't
have data about submerged operations, since the pastures we use are in the
winter dought periods:-)

Frequency stability as well as performance are better than I would have
expected in a radio shamelessly abstracted from Motorola's Apps notes.  They
continue to put out 2 watts religiously.

I may have just been lucky (Yeah, Gwyn, I really know better) but I've been
able to get 19.2 kpbs performance out of them without swapping front-end
filters.  On this, your mileage may vary.  Several of us here in town also
have 'em on amateur applications, and they just keep on working.  Well.

73, gerry

OK, how about a "time query", just like the position and wx queries?  By
default this function would stay off unless invoked.  One station could be
designated "time server".  Then during an event a bulletin could be sent
asking all involved to set their clocks this way...

Another idea is to set the clock automatically from any valid GPS string,
unless the time isn't sent over the air (I can't remember offhand).

WB4APR REPLY COMMENT:   Since the on-air protocols only report to the
minute, and errors less than one minute have no effect on my dead
reckoning and loging, I would be happy with half minute accuracy...
Here are my thoughts:

PROBLEM:  Because of the way some TNC's have implemented the GPS timing,
you can NOT tell if an on-air GGA report is in real time, or delayed by an
indefinite time, (Days in some cases..  THe TNC just keeps beaconing the
OLD GPS posit and time...)

I suggest the following:

* A user setup function says that you will accept over-the-air GPS timing
  commands or not.  The defualt is YES

* A station known to be in GPS sync can MANUALY activate a periodic
  APRS-GPS-TIMESYNC packet.  This packet only contains the UTC DATE, HOUR
  and MINUTE.  When it is time to be transmitted, it will be initiated
  at the Start of the minute. (00 seconds).  As long as it is received
  within say 15 seconds, it will be close enough for all my purposes with
  dead reckoning etc...

Remember that the time from when the PC initiates the packet, until it even
gets transmitted is also ambiguous due to channel busy...  So I see
no reason to try to do better than a minute.  On receive, I will probably
add 5 seconds if heard direct, and 10 seconds if heard via a digi to make
up for average delays.  Just a guess....
```

For what its worth, I agree with Keith (see below) about WANTING to sync
time.  The general field of time synch is not as easy as it may appear to
be, unless everybody is on a specific reference time, such as UTC.  (Which
is obviously the way She wanted it to be.)  Unfortunately, it doesn't work
out that way.

However, *almost* anything is better than every station in a network keeping
their own time.  I think Keith's idea is good enough to work, simple enough
to implement, and will provide *good enough* time (within several seconds,
which is MORE than adequate).

Good idea.  Hope to see it some time

Donn

<CUT>
 the desire would be to assign a SINGLE station as the 'TIME KEEPER',
and have it send out a TIME SYNC packet, and everyone that was hearing that
AND THAT WANTED TO, could sync onto that time..

In actuality, this is very easy to do, the question is IS THIS WHAT IS
WANTED?

I would like to hear some comments pro and con...

My comments:
PRO:    For the 'special event' situation, this would be a GREAT idea.
CON:    I don't want MY clock goofed up by what time YOU think it is...

WB4APR REPLY COMMENT:   Thats what the PC alt-SETUP-GPS-TIMSYNC command
does.  It will take the time from the next GPS string no matter whether
local or over the air.  BUT it should be used with caution, since some
TNC's continnue to report OLD posits...

OK, how about a "time query", just like the position and wx queries?  By
default this function would stay off unless invoked.  One station could be
designated "time server".  Then during an event a bulletin could be sent
asking all involved to set their clocks this way...

Another idea is to set the clock automatically from any valid GPS string,
unless the time isn't sent over the air (I can't remember offhand).

Hello Bob:

Yes , I sent you a check for $33.00 to register for the APRS7 program and I had
written you a note to be included with the check but it did not get put in the
envelop.

I got your return card today in the mail and I brought it home and was doing
several things around the computers and tried the program.  But my problem is I
told myself to put the card in a safe place so I would have my number.  Well I
have looked in the trash and all around the radio bench and I have put it up too
good because I can not find it now.

I think my number from memory is 15659.   Could you vertify that and if wrong
please send me my number over e-mail and also send the text that was written
on the post card.

Thanks and 73,
Bob Hill, W5FBQ

353. Time Sync for APRS..

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Thu, 15 Feb 96 21:42:27 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.824438547.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

```
Okay, here goes.....

The way I see it, I am going to implement the following:

This will be in MacAPRS soon, and WinAPRS in the not too distant future..

In MacAPRS, there is a command "SET TIME FROM GPS", in the Macintosh version,
this will ONLY work from a LOCAL GPS LIVE signal, and NOT from over the air
PACKETS..  It takes the NEXT VALID TIME signal from the GPS data, and sets
the clock accordingly..

I am going to add a command SYNC TIME that will sync to a UTC TIME packet
received over the air..

The TIME received over the air will be a NEW FORMAT, or will be a NMEA
format, (Currently undecided, comments?)  The time that will in hrs minutes
AND seconds...   This is because we CAN get better than one minute accuracy
at this, especially in the case were we are all listening to the same digi,
which is usually the case in special events..

(I like the idea of having it set so that it will only affect stations within
a given radius of the sending station)

The SYNC TIME COMMAND will be a ONE-SHOT deal, meaning that it will set a
flag to SYNC on the NEXT TIME PACKET it sees, then it will CLEAR the flag and
NOT do it again unless the user re-selects the command.
```

```
The TIME will ALWAYS be in UTC (as received from the GPS), but the computers
will set the LOCAL clocks according to their UTC offset..

To SEND a time sync packet, it MUST be EITHER:

        MANUALLY DONE, ONE PACKET AT A TIME...

        OR

        Have a REAL GPS (Yes MacAPRS/WinAPRS knows if it is LOCAL data)
        on line and receiving VALID data from the GPS..
        Then you will be able to tell it to send the data out on a periodic
        basis...  It will NOT allow this to be done more than once every
        hour for AUTOMATIC transmissions (use manual for more often)

The reason for allowing a MANUAL time packet to be sent is if your special
event has a LOT of GPS's running in the field, but no GPS units at the
stations with people at them...

Mark (KB2ICI) even commented that he wouldn't even mind having his clock set
on a DAILY basis to be sync-ed up to a KNOWN accurate time clock..

I have some GPSs here, and if some of the local people wanted this info,
I would go so far as to put one on FULL TIME, and send out a TIME SYNC
Packet every night at 00:00z..

I would also recommend to NOT sync up to time packets from HF...  :-)

Actually, one should sync from a close, and known, GPS if possible.

Bad idea:  Induces 'way too much opportunity for system latency.  Update from
one of the GPS trackers.
```

```
> PRO:  For the 'special event' situation, this would be a GREAT idea.
>
> CON:  I don't want MY clock goofed up by what time YOU think it is...

So you get your clock (at least the minutes) set to GPS time.  What's the
malfunction?  Most fo us are trying to keep reasonable time...

If there's a way to get all APRS bases to periodically update the clock from a
GPS, that's great.  I agree with Dave Barow, that a zero-digi path may be
acceptable.  Get  couple of digi's in there, and we're dead!

Most of the NMEA strings contain date and time. What I would say is that
any such string could be used, e.g. RMC or GGA from a stand alone
tracker. I think there is even one that only has time info that would be
perfect for transmitting from with Mac/WinAPRS. Also, I'd like a limit on
the amount of error the program will correct. Most computer clocks are
reasonably accurate, and if there is bogus data on the net (say more than
a few of minutes) I wouldn't want my clock reset, but maybe a warning
that tells me about the discrepancy would be nice. The program could put
a message in the message window saying 'Warning...invalid clock
syncronization data' or some such.

>(I like the idea of having it set so that it will only affect stations within
>a given radius of the sending station)
>
Rather than using distance, I would say it is more important to limit it
to at most a single digi...longer paths would add more potental to get
hung up on a busy channel.

Hi there, There is another radio very similar to the  TEKK radio
Made By MAXON.  They make both a VHF and UHF radio. 2 and 5 watt
versions.

Both the VHF and UHF radios are capable of 9600 baud packet, and
with the addition of a switch are cabable of 4 channels.  (The
trim caps are also missing, but the board has spots for 4 pairs
of XTALS.)

The VHF radio is a DM-0510 (I can't remember for sure) and
the UHF radio is a DM-0530 (I know for sure, I use one.)

The radio's are a little larger than the TEKK radio's, but use
the same DB-9 style data connector for the power/data, and the
BNC antenna connector.

I think it's simply a bad idea to try to sync time over AX.25.  It
really won't solve the problem at all on busy links.  When I send a
packet to my TNC to be transmitted, I have NO IDEA *when* it will
actually be transmitted.  On extremely busy channels, which we have
a lot of over here in Europe, it can sometimes be well over a minute
or more.  And that's just for the first hop of a multi-hop path.

Don't misunderstand.  I think it would be really cool to have on-the-air
time sync, but via packet radio as it exists today is NOT the way to do
it.  I don't object to having some functionality added to APRS/MacAPRS
as on quiet channels in some areas it would probably work quit well as
long as everyone understood that there can still be a very high error
in the time reported.

We should instead focus our efforts on stressing to everyone who runs
APRS the importance of keeping accurate time.  For example, those in the
U.S. can sync. up to WWV and those here in Europe can use the 77-KHz
time standard frequency and $10 radio-controlled clocks.  Unattended
stations which can't adjust their TNC/compute clocks every day or so
should find a way to make the TNC clocks more accurate or syncronized
with a time standards station -- but not on the air using shared-
channel/AX.25/CSMA!

I was trying to think of a way to encourage/force users to keep their
clocks accurate.  The S/W mod. idea is the best I could think of, but
I wouldn't call it a "time sync" function -- that's too misleading,
especially to new users who don't fully understand e.g. how packet works.
We need to think of a name so people don't forget that it's not a very
good way to sync up our clocks at all.

Meanwhile, we need to come up with a cheap radio-controlled clock that
works with the time standards stations and connects to your serial port
(perhaps with a clever way to share the port with TNC/GPS/weather stations).
Such devices are already on the market, but are rather expensive, esp.
in the U.S. (I hear).

```
Well, I am suprised! the Time sync topic seems to be very popular and
even dicussed rationally, maybe there is hope for this SIG yet!!

Having read the past 20 or so replies on the topic, I think there are
some good ideas here. I like Keith's version the best overall I think.

I would like to see the following parameters in the time-sync function
of aprs in whatever flavor you happen to be using:

1.)     Limit to one digi in path.
Any further away and the time data is too old to be useful. And in
keeping with the intent to sync local, specialized nets for events which
appears to be the most useful application of this function.

2.)     Only one designated time-server per area, possiblly easiest to
implement this by limiting to a aprs station with the computer online
24hr/day (maybe a WIDE or GATE or Wx station).

3.)     Default should be query-mode, i.e. the operator must manually
query the local time-server for sync data. (I also would not want my
clock being reset by some remote station). Option would be to enable a
once-per-day auto-sync mode to the local time server. Computer clocks
are accurate enough for our purposes to keep in reasonable sync for 24
hours at least. TNC clocks are probably not so accurate, but TNCs (most
of them I believe) have a time tweak function built in, why not use that
on stand alone stations? It requires setting the time agaiinst a known
standard and manually tweaking the fudge-factor to get the TNC clock to
keep good time.

4.)     All time sync should be in UTC, with adjustment made on the
local machine for time offset from the parameter already entered into
the configuration of aprs.

Glad to see everyone pulling together on this one, the time sync
function has some viable uses buthas the potential to be disruptive
 to the net and/or abused if not carefully implemented.

73...Bob

You can order them from Conxall at 708-834-7504 but they will be
rather expensive.  You can get then cheaper from Electro Shield at
513-767-1054. I think they both have minimum orders.

Let me know what you find out and good luck.

368. APRS75

From: gwelte@northernnet.com (George A. Welte)
Date: Fri, 16 Feb 1996 10:37:42 -0600
To: aprssig@tapr.org
Message-ID: <v01530501ad4a0bdeafb5@[206.24.45.45]>
Rendered body type: text/plain

```
I Have APRS75 running with the U2000 and AEA232 TNC.  I'm operating the
system as a remote weather site at this time since I only have one Serial
Port that I can use for APRS.  In the set-up I go through and validate APRS
on Port 2 and get it up and running.  Then I go back and validate the
weather mode on port 2.

All I get on the screen is the blue symbol of a weather station plus when I
enter the "n"key I get the following screen:  NØWBU    000:00   MPH   F.
APRS is not reading the U2000 for some reason.

The weather station is putting out a string of information so I know it is
working.
```

Is there a better way of validating both the APRS and the WEATHER together
for a remote weather station when only one port can be utilized.

Any other clues from anyone - Your help is appreciated.

> a given radius of the sending station)

I like Keith's proposal as well, except for this. Out here in the desert our
digis are way high and about every 60 mi or so. If we could have the number
of digi hops be a factor rather than the distance, I think it would work better.

On the other hand (refuting myself) relaying the time info thru only *one*
digi out here can change the time in a *huge* radius!

Im confused. To me, a "remote wx site" means ony a TNC, radio and a
U-2000. THere is no APRS at that site...

The only way that APRS will work with the Ultemeters is to have a
dedicated COM port for the instrument...

If you are saying that you disconnect the TNC, and only want to see your
own WX on your OWN screen, then I suppose a single port should work. Be
sure you are in data logger mode on the U-2000 and you must wait the
APRS-POSRATE time before an update will occur. Should default to 20
seconds I think... If im missing something, try me again...

372. As long as you are including options like the number of hops, here are a couple suggestions:

From: Simon Quellen Field <sfield@wpo.borland.com>
Date: Fri, 16 Feb 1996 10:21:44 -0800
To: bruninga@nadn.navy.mil, aprssig@tapr.org
Message-ID: <s1245a65.021@wpo.borland.com>
Rendered body type: text/plain

As long as you are including options like the number of hops, here are a couple suggestions:

1. Only accept times that are within N seconds of what I think the current time is.

2. Only accept times that are EARLIER than what I think the time is. That way, if I am
    accepting times on a busy channel or through digipeaters, I will accept the most direct
    an un-delayed time.

>>> Bob Bruninga <bruninga@nadn.navy.mil> 02/16/96 08:00am >>>
We could use the format: !APRS2 DD:HH:MM:SS

Bob--Thanks for your reply to my question- I know that a remote site
only uses
the radio, tnc and a U-2000. I'm refering to the initial set up of the TNc
that will be used at the remote site. In other words the configuration of
the commands and also do both
the APRS validation and the Wx validation have to be entered in to the
remote TNC. If so
how can this be done if only one port is available? After I get the remote
set up I monitor it with a separate radio, tnc & monitor. Iknow this is
probably confusing and I've tried lots of variations but not the right one
- I guess.

I have been following with great interest all the time sync stuff.

Several great points have been made.  The issue originated by a
user who, during an event had a problem.

Solution #1
Write software

Solution #2
Operators are responsible for ensureing that their radios are on freq,
and operating properly.
Here's a novel idea....set your clocks if needed !!
Whats the big deal!   Too much effort and bandwith on this guys!!
Just insure that your system is operating properly!

I tend to agree with the guy who wrote that people cant even set their
digi paths correctly, no thanks guys, I'll set my own clock !

```
Ummmmmm....  Uhhh... Shannon's right.  I check all my computer clocks
     once a week or more often (usually) against WWV, and make sure that
     they're within a second or two or three or five.  I think that it's
     gotta be the operator's responsibility to make sure his equipment is
     on time.
```

However, it would be really cool to have an automated time code system. There's the dial up service to WWV, to get a time tick over the phone. Anyone with a modem can do that, and that could be part of the APRS code. Or, use the GPS receiver's time code output. Maybe there's some soul out there who would want to take one of the Motorola receivers on a chip, build a neat little 10MHz receiver, receive the time code generated by WWV, and serial-output it to our computers. That would be nice. There are commercial boards available for the PC that do this, but are expensive.

I for one, would not prefer to use some one else's time code transmitted over the air to base my whole computer's operating system. How would I know it was right? Unless, of course, it was KE4EER's. %^)

Author: S.Miller@RUS.Uni-Stuttgart.DE at Internet
Date: 2/16/96 12:27 AM

I think it's simply a bad idea to try to sync time over AX.25. It really won't solve the problem at all on busy links. When I send a packet to my TNC to be transmitted, I have NO IDEA *when* it will actually be transmitted. On extremely busy channels, which we have a lot of over here in Europe, it can sometimes be well over a minute or more. And that's just for the first hop of a multi-hop path.

Don't misunderstand. I think it would be really cool to have on-the-air time sync, but via packet radio as it exists today is NOT the way to do it. I don't object to having some functionality added to APRS/MacAPRS as on quiet channels in some areas it would probably work quit well as long as everyone understood that there can still be a very high error in the time reported.

We should instead focus our efforts on stressing to everyone who runs APRS the importance of keeping accurate time. For example, those in the U.S. can sync. up to WWV and those here in Europe can use the 77-KHz time standard frequency and $10 radio-controlled clocks. Unattended stations which can't adjust their TNC/compute clocks every day or so should find a way to make the TNC clocks more accurate or syncronized with a time standards station -- but not on the air using shared- channel/AX.25/CSMA!

I was trying to think of a way to encourage/force users to keep their clocks accurate. The S/W mod. idea is the best I could think of, but I wouldn't call it a "time sync" function -- that's too misleading, especially to new users who don't fully understand e.g. how packet works. We need to think of a name so people don't forget that it's not a very good way to sync up our clocks at all.

Meanwhile, we need to come up with a cheap radio-controlled clock that works with the time standards stations and connects to your serial port (perhaps with a clever way to share the port with TNC/GPS/weather stations). Such devices are already on the market, but are rather expensive, esp. in the U.S. (I hear).

WB4APR REPLY COMMENT: Ah ha!. APRS has nothing to do with a remote
site. You set up that TNC according to the TNC instructions and the
suggestions in my WX.txt. Use a DUMB terminal program. Do NOT use APRS
since APRS will change the TNC settings that it likes, NOT what is needed
at the remote site. WX validation only works when you plug in a
Ultimeter to APRS...

379. MacARS 2.4.0

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Fri, 16 Feb 96 21:35:19 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.824524519.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

MacAPRS 2.4.0 is now up on the servers...

        msproul.rutgers.edu   (also called aprs.rutgers.edu)

        ftp.tapr.org

This version HAS been long in coming.. But it has a lot of new stuff in it.

        * MAPS BETTER MAPS MORE MAPS ETC...

MacAPRS now supports polygon filled maps. A POLYGON feature is like a lake or city, that is filled in with COLOR instead of just a line around the object.
The NICE thing about this is that the NEW map formats are 100% backwards compatible, and 100% compatible with WinAPRS
If you put a NEW map into an OLDER version of MacAPRS (or WinAPRS) you will simply get the line AROUND the object. In the newer versions, you will get the object filled in..
Cities (populated places) are now filled in with YELLOW..
Lakes are filled in with DARK BLUE
Vegetation (Parks, etc) are filled in with GREEN
..and I am working on lots more stuff.
This is mainly due to date with more info coming from the DCW (Digital Chart of the World) CDs...
Check out the Web Pages with the new maps..!!

* LABEL RANGE
  In the past, MacAPRS has totally ignored the label RANGE.
  Now, the labels in Maps behave just like on the DOS version.
  i.e. they show up when they are supposed to.

* You can now PRINT from any of the LIST windows
  (Before you could ONLY print from the MAP window)

* All of the LIST windows have been re-done and are more consistent
  (There are couple of cosmetic problems, ignore them)

* The first pass at the TIME SYNC (Manual Sending) is implemented
  It DOES send the time over the air, but nothing gets done with it.
  (If you haven't been reading the SIG in the last few days, ignore this)

* You can now have up to 64 sub-directories in the MAPS folder.
  The PREVIOUS limit was 32..
  Yes, somebody exceeded it, Right DAVE :-}

* You can SORT the messages in the MESSAGE window by clicking on the COLUMN you want to sort by..
  The DEFAULT (obviously) is sorted by DATE/TIME received.
  But you can now sort by WHO FROM, WHO TO, Message, and of course Date/Time Received.

* The WHEN list is much different, it now has a bar-graph instead of just a list of numbers.

* The DIM-OUT time-out value will cause stations that have NOT been seen in the specified time to show up in ITALICS in the STATION LIST.
  The DEFAULT values are to TIME-OUT in 24 hours, and DIM-OUT in 18 hours. If a station appears in ITALICS in the STATION list, it will disappear 'soon'.. If you don't like the ITALICS, Just leave the DIM-OUT value at zero.

* MAP LIST
  Due to the MENU limitation in WINDOZE (you can only see as many menu items as will fit on the screen WITHOUT scrolling), we added a WINDOW that shows all of the available maps, and other info about them.. You can double-click on any one of these and it will bring that map up in a new window..

* Automatic handling of PC-APRS Maps.
  In the past, if you wanted to use maps from the PC/DOS version of APRS, you had to CONVERT them, using the CONVERT command under the FILE menu.
  NOW, you can simply throw the maps into the MAPS directory and MacAPRS will read them directly.. no conversion needed..

* Weather Display
  If you have a Peet Bros weather station, there has been a couple additions to the current weather display, including hi/lo times.

** Memory Leaks
  There were a couple of problems that caused the program to chew up memory as you used it, especially if you loaded/reloaded lots of different maps..

Keith

PS: See, we haven't just been doing WinAPRS, in fact, I don't touch the
Windoze stuff.. Mark does all of that..

Keith and I will work out the details. No one's clock will be adjusted
unless he authorizes it.

For the future, GPS IS TIME. W3IWI Tom CLark has been excited about the
fantastic potential for near microsecond (I dont know exactly, I may be
off by orders of magnitude). But even the cehapest Garmin OEM cards now
come with GPS time pulses STANDARD!

Review past articles about coherent CW and seeing signals N dB below the
noise! In my opinion, the avid experimenter will certainly have a
permanent GPS receiver in his shack for precise time. Imagine doing EME
with 100 watts and a beam (and precise time to drive the DSP!)

I have several of the 8 channel Garmin boards on order. If I like them,
we might be able to make a mass purchase and make them available for
about $149...

Having your own GPS is the ONLY real way to get PRECISE time over the air.
(for around a hundred bucks...?)

386. Time Sync Proposal

From: Mike Musick <71301.3106@compuserve.com>
Date: 17 Feb 96 01:15:27 EST
To: <aprssig@tapr.org>
Message-ID: <960217061527_71301.3106_FHJ27-2@CompuServe.COM>
Rendered body type: text/plain

I agree with the request for a remote time sync protocol. It would be a
wonderful luxury for everybody in a time-sensitive event to have a GPS for
accurate timekeeping whether they were mobile or not, but the key word here is
luxury. Time sync is critical for local events, and when you cannot depend on
100% availability of GPS time standard at every station, *someone* has to set
that standard.

Also, an application that I have in mind for an APRS network is an automated RDF system, and the ability to remote time sync is important to me; I would like to avoid the extra cost of putting GPS's at fixed sites just for timekeeping purposes.

Sloppiness in timekeeping is an authentic problem, and provision for a master/slave relationship is certainly consistent with professional-grade event communications management.

What I would like to see, adding to or amending the suggestions so far.

1) A tiered "enable" system: [N]one; [O]nce only, on next sync; [A]lways sync to master; [M]aster station.

2) A specific "sync to" station, in the normal alias or callsign formats. I think allowing just any station throwing out a time sync beacon to reset your clock is courting problems.

3) The digi hop limit is important, and I think should not only be user specifiable, but also limited to a max of two.

4) I know it's too much to ask, but I wish there was a way to prevent retries on clock sync packets. If you didn't hear it the first time, tough, 'cause a retry will have the wrong time.

The argument voiced about the problems of AX.25 traffic getting in the way is legit. However, it's my feeling that if the APRS event is critical enough to make sure that everyone's sundials are all pointing north, then it's critical enough to find a frequency with less contention.

Generally, I think everyone has to realize that time sync'ing this way is less than perfect - we're not going to get nanosecond precisions here. But with the way I've seen PC clocks drift (and their owners sometimes completely oblivious to that fact), there's got to be at least the provision for a mechanism which gets everyone in an event support situation roughly timed on the same minute.

Right, so hopefully it isn't difficult at all for all GPS owners
to keep the right time (perhaps they need a software hack still to
parse the time string from the GPS unit over the serial line and set
the computer clock and TNC clock accordingly).

I like the idea of limiting the number of digis for time announcements
on the air.  Perhaps not even allow *any* digis.  Or maybe that's too
restrictive.

Also, the announcements should of course be UI vs. connected frames.
No retries for those who miss a time announcement!

Perhaps RFC-957, RFC-1769, RFC-778, RFC-1305 and other RFCs for time
sync. on the Internet could provide more ideas here for making
something work on the air that's good enough.  As long as we never
call it "precise sychronization!"  ;-)

Rendered body type: text/plain

```
Just a brief note to those of you who have been unable to
get the DOS version of APRS to work with your Peet Bros.
U-2000.

The beta WinAPRS (.2.4) code released yesterday works
perfectly with the U-2000. The beta code currently only
supports serial I/O under Win95 or NT so Win3.1/Win32s will
not cut it yet. Mark is working hard on it.

If Wx is your primary interest and you have a U-2000, it
is well worth looking at even the beta code, if you have
Win95 or Win NT.  (This version also supports CDROM callbook lookup of
several of the common CD-ROMs as well)

For those users in Madison Wisconson, i have made a grid of 1.5 mile (3 mile)
maps (15 in all) of Madison WI. there where several users wanting these maps
and i forgot who they where!. These where about the hardest maps i ever
made due to the many,many bugs in the software. It looks to me since the
basis of APRS is MAPS that there would be someone that would take the ball
and improve the mapmaking software at sometime. There was one map in the
grid (1.5 mile) that after building the map and was in the chaining process
just quit and locked up my machine, yet would run all the way trough at 1.4
miles, now i know it's not a memory problem!. Anyway i will post the maps on
Tapr as MADISON.ZIP you will have to add them to your own maplist.

One thing that might be considered is to have the recieving computer
process the information a bit.  What I am suggesting is that the computer
see how far off it's time is and make a correction factor that can be
used to keep the time in synch without constant remote adjustments.  This
will need a little consistently.  This idea will work especially well on
the computer taking a direct GPS time correction.  It will also be
reasonable to use on a computer which gets it's time correction from a
single APRS station.

Just an idea.

I think it would be useful, especially for keeping computers in synch
during a special event (ie a race where time is critical).

Besides, all suggestions have been that it is an optional feature to
utilize the time data or ignore it.

396. APRS Kam+ problem update

From: Grampyruss@aol.com
Date: Sat, 17 Feb 1996 13:15:17 -0500
To: aprssig@tapr.org
Message-ID: <960217131515_424952452@emout04.mail.aol.com>
Rendered body type: text/plain

Bob,

I sent you an earlier Email regarding the problem I was
having running your share ware APRS program. I finally
found out that there were two basic problems as shown
below. Problem #1 was avoided by allowing the Windows
program to load up and then exiting to DOS and creating
a BAT file that opens and runs APRS from DOS only.

Problem #2 was found to be caused by the KaGold software
that leaves the program in "HOST" mode as described in
the KaGold software manual, pg 99 which is described
below.

Accessing the TNC from the TERMINAL application shows
COM PORT 2 which is used for my modem.
COM PORT 1 which is used for the TNC shows no setting
for the baud rate and selecting baud rate 4,800 cannot
be "saved as" unless a directory/file/ext is entered

which I would have to assume would have to become part of the APRS start up routine. However, not being a software Guru, I am not certain if their is still a conflict with the KaGold software program as it does it's exit procedure or if I choose the "terminal" exit mode In KaGold what that involves in the start up program for that program. Before I call Interflex to see if I could resolve this problem I thought I would ask your advice and thoughts on the subject. I am sure that there will be other hams running KaGold that will eventually learn about APRS and run into the same problem.

Thanks, Grampyruss@aol.com

Problem #1

```
386MAX Version 7.01

An application has violated system integrity:

A Priveleged operation exception at 0070:06F4 has occurred

MM> A progrm has attempted to use system resources im-
properly, or to use non-sharable resources already in
use. The 286/486 processor has reported this event to us
so we may assist you in diagnosing the problem.

Temporarily remove one or more of your device drivers and/
or resident programs to find the program in conflict with
those resources. use 386UTIL /D  /M to identify device
drivers and resident programs. For reference, the last
last program to load is

C:WINDOWS\SYSTEM\WIN386.EXE

If a specific vendor's program can be removed to prevent
this conflict, please contact that vendor. Qualities
Technical Support is ready to work with you and the vendor
to resolve this problem.

MM> Press any key to reboot the system
```

Problem #2

KaGold Manual page 99

TNC Mode on Exit is either HOST or Command mode. Use HOST mode UNLESS YOU PLAN TO USE OTHER PRGRAMS. If you run some other modem type program, you can always "pop" the TNC out of HOST mode (if applicable) as described by the TNC supplier. Typically, this means sending three Control C characters to an AEA tnc or FEND Q FEND (Alt-192) to a Kantronics tnc.

==

Note: If you elect to exit in CMD mode, the contents of the shutdown.tnc are sent, followed by the contents of HOST2CMD.TNC file. This is important to remember, and a good way to set special parameters when existing (I think this word should be "exiting") in CMD mode.

The CURRENT release of WinAPRS is on   aprs.rutgers.edu and will be on TAPR before the end of the day today...

If you go read the original announcments (up on the Web)

http://aprs.rutgers.edu/APRS/

It is schedlued for version 1.0 at Dayton 1996..

400. Davis WX station

From: KSwaggart@aol.com
Date: Sat, 17 Feb 1996 20:48:03 -0500
To: aprssig@tapr.org
Message-ID: <960217204802_224776494@emout06.mail.aol.com>
Rendered body type: text/plain

A few weeks ago I recall some messages regarding the output coding from the Davis weather station. If anyone has the conversions I would appreciate if they would pass them along to me. Intent is to build a little program to covert the Davis output into an APRS readable wx report format using a spare 286 PC.

Tnx es 73,
Ken, W7KKE

Howdy from 9 land,
I am running Kam+ in mobile with Garmin45. I am running as a -9
which shows up on DOS aprs as an auto. On MacAprs I have to insert
{>} into the btext area in order for mac to recognized the car icon.

My question. If I include the {>} in the btext area, it won't show
on the screen until I beacon. Has anyone put the {>} into the LT
(locate text) buffer with any success.

I am gg to try, but was curious of other who run aprs mobile with
kam+ wanting to display auto icon on the mac. This is the only way
the auto tracker feature works.

Thanks,
Jerry

Rendered body type: text/plain

I am running Winaprs 2.2 on win95 and NT 351, The TNC is a PK900.

I can recieve info and the map show a call and object, but no
transmit??
If I switch to aprs74 that is shutdown Winaprs and the run aprs (dos).
APRS runs as expected.
The only mods I made to the .cfg was my call and position. Is there a
ascii file that I can get at that contains the TNC setup?

403. Low cost GPS receivers.

From: "Bruce W. Martin" <martinbw@telalink.net>
Date: Sat, 17 Feb 1996 21:37:45 -0600
To: aprssig@tapr.org
Message-ID: <9602172137.AA45061@oscar.telalink.net>
Rendered body type: text/plain

I am looking for a low cost GPS receiver for a standalone tracker I am putting
together. I have a low cost transmitter and am considering the MIM module or a
used KPC-3. I saw some mention of $100 GPS receivers in a message. I don't
need a display just serial output and an antenna.

TIA

Bruce, KQ4TV

Jerry...

You need to go into the GPS SETTINGS and set the SSID icons to the DEFAULT..

Chances are that you have the SSID -9 set to something else, possibly
nothing..

Keith..

I have done some clean-up on at the TAPR ftp site..

I moved the following:

        PC maps into the folder  PCMaps

        DOS utilities into the folder    DOSMisc

        the MacGPS programs into the folder    MacGPS

I have also deleted some of the OLDER versions of PC APRS..

There are SEVERAL things up there that I don't know what is..

If you have put stuff up there, or if you do so in the future, PLEASE let me
know what it is by direct e-mail, NOT via the SIG..

411. MacAPRS v. 2.4.0

From: N9APP@aol.com
Date: Sun, 18 Feb 1996 13:12:54 -0500
To: APRSSIG@tapr.org
Message-ID: <960218131253_325702071@emout10.mail.aol.com>
Rendered body type: text/plain

```
To Mark or Keith Sproul / or anyone that can help.

I downloaded the new version of MacAPRS v. 2.4 from your FTP site and
retrieved the .sit file.  When I try to unstuffit using the Stuffit Expander
program that you and I worked with at the Wheaton Hamfest here in Chicago,
nothing happens.  I drag the .sit file to the Expander program icon, and I
can see the Expander window open.  After 2 seconds the program closes itself
with no action report and no expanded file.   I then started the Stuffit
Expander program by itself.  I selected "expand..." from the files menu and
selected the .sit file.  Again, about 2 seconds of hard disk action then
nothing.  Again, no expanded file or error reports.

Now I went to the Stuffit program and selected the "Binary decode" section
and tried that on the .sit file.  This time I got indications of CRC errors
in the starting bits.  It stated that the program could not be decoded.

One thing that makes me courious is that if I look at the .sit file through
```

"Get Info", it is described as a America OnLine document file. I wouldn't think this would make any difference but you never know. Perhaps my AOL software is doing something to it.

For Info:
I have Expander version 3.5.2 from the hamfest and
Stuffit version 1.5.1

Is the file on the FTP bad (I'm sure not likely...worth asking) or what might I be doing wrong?

Thanks for your help guys!

Rendered body type: text/plain

I have no excuse but lazyness for not puting the 80M gate back up in the past 2 weeks, sorry. During my VERY short stay at the Orlando Hamfest I found the lazy man's way out of TNC cables, a pre-made MFJ cable for a KAM to Kenwood HT and I bought it.

Later tonight (Sunday) once I clean the desk up I will have the 80M and 30M gate up and runing 24hrs 7days a week for good. Let's try to get some activity going again, I know that the Orlando bunch had a better chance to get thru via 80M in Tampa to the SE than on 2M, hopefully the 2M side will become reality in the near future.

The frequency is 3.585 LSB and it will probably take a couple of days before the regular bunch zero beats together again as before.

73's and hope to see you there!

415. WinAprs isn't working here.

From: "Holstein's" <holstein@erols.com>
Date: Sun, 18 Feb 1996 18:17:34 -0500
To: aprssig@tapr.org
Message-ID: <199602182317.SAA29712@mail.erols.com>
Rendered body type: text/plain

I've tried running WinAprs 022 and 024 and neither have worked. I changed the Config File to have my call sign, position, and validation number. I will try it with the default validation number but I don't suspect better results.

I cannot open the VHF TNC port to get any i/o between APRS and the TNC. I have no trouble using another terminal program so it's definately in the WinAprs software.

Help.

IF you are running Windows 3.1....WINAPRS isn't working with that software yet. Code is being written as we speak. If you are running WIN95, check your port settings in the Control Panel and make sure you have the proper baud rate in WINAPRS set in the config file, as well as the correct port.

Don't give up. If ur using WIN95...it works, if not....you may want to try the MAC version 2.4.0...It is awesome...I run both and my mac announces spots and messages.......enuf commercial...

GOOD LUCK....

In very short order, the Davis unit will be supported by MacAPRS and
WinAPRS, so dont go to to much trouble.  We have the docs on the format and
it will probably be in the next release.

Mark

After going back and reading this thread, it looks like everyone is
overlooking a very good system for updating the computer clock.
Most ISP's have a Network Time Server (NTS) running on their server.
These are typically Stratum 3 servers, that is they are two levels below
a Stratum 1 system which is usually driven by a cesium or rubidium
standard.
Software is available over the Internet. A good source is the US Naval
Observatory at http://tycho.usno.navy.mil/. This site also has
documentation on the various NTP servers and their accuracy.
Before I got on the Internet, I used a program that called the NBS site
at Boulder, CO. which automaticly updated my PC clock. After I got an
account with an ISP, I started using a program called Timesync.exe. My
ISP had not implemented an NTS at that time, so I was accessing a Stratum
2 NTS at Jet Propulsion Lab in Pasadena, CA. Every morning I would call
the NBS site in Boulder and sync the PC clock and then access the NTS
server at JPL and sync from there. I never saw any change in my PC clock
to the nearest second. After Pixi.com drought an NTS on line, I did the
same test daily for several weeks with the same accuracy. Given the
limits of the PC clock system, I believe this is as good an accuracy as
can be expected.

I hope this is some help.

As the other Dave from Hawaii says, it's time for the beach.

>Make that 50 ns accuracies

No -- not the complete story. It would be typically 50 nS without the
intentional degradation of the GPS signal by the D.oD. This intentional
degradation is called Selective Availability. A 150 meter degradation in
position translates into a timing inaccuracy of 500 nS. This is the level
of expected accuracy for a standard GPS receiver operating in a
non-differential mode.

```
The typical timing output from a GPS receiver consists of serial data plus
a synchronizing pulse.  This is often called "1 pps" or "one pulse per
second".  The edge of the 1 pps corresponds precisely to the roll-over of a
UTC second.  So to precisely set a PC clock you need to read the serial
data AND synchronize to the edge of the 1 pps.

Fortunately, a 1pps signal is standard on most GPS engines so the
capability is there for time sync to less than a microsecond.

```
Hi there,

I've been working on making maps around Titusville FL, and have an
interesting technique. I get a fairly good street map, then copy it
using an ordinary copier - onto graph paper! I use the closely
spaced graph paper I find at the drug store, or the Five & Dime. The
only problem here is making sure the map stays straight on the glass
as I close the top over the original, so that streets line up with
the lines on the paper.

After that, I just put my own numbers along the top and side of the
page, and take my new paper map and Model-100 laptop with me to the
laundromat to enter coordinates while the laundry is cooking. I
transfer the straiht ASCII text file to my PC when I get home. I also
use WordStar in Non-Document mode, or (on a Windows based machine),
I'll use Notepad. My problem now is coming up with a "range" for the map.

   Question: Is there a mathematical relationship between the
   range milage, and the distance between the 0,0 coordinate
   and the Map Center coordinate? What about "Pixels Per Inch"?

The real question is, How do I pull the RANGE and PPI numbers out of
thin air? Is there a rule of thumb? Thanks for the help.

     Ozzie

426. Picking a TNC

From: Robert Busch <0006867555@mcimail.com>
Date: Mon, 19 Feb 96 12:15 EST
To: APRS SIG <aprssig@tapr.org>
Message-ID: <30960219171503/0006867555DC6EM@MCIMAIL.COM>
Rendered body type: text/plain

Given a rule that says I can have only one HF and one VHF radio and only one
DOS/Windows PC and one TNC, it has been useful to read the sig messages as I
pick the one TNC. But the sig messages cause a question: is it better
to buy a packet only TNC and avoid the complications that always(?) come with
more options and flexibility and be happy with APRS and packet only, or is it
better to put up with some pain to also have other HF modes? Only one example,
for instance, would be a KAM Plus or a KPC3? Price plays, of course, but
buying a replacement TNC later to gain more modes makes the price question
a false one; two are not cheaper than one.

I don't know if Tom, W3IWI, reads this list (if he does, he'll probably jump
in here) but his "totally accurate clock" project uses a Motorola GPS engine
to derive the 50ns accuracies Gerry mentioned, despite SA. He's verified that
performance against USNO.

428. QTH APRS CURSOR DEFAULT

From: Wb2ngz@aol.com
Date: Mon, 19 Feb 1996 13:56:59 -0500
To: aprssig@tapr.org
Message-ID: <960219135658_426310321@emout09.mail.aol.com>
Rendered body type: text/plain

This may be old news for the experienced, unregistered APRS users but I
thought I would pass it along anyway. The registered users do not need
this modification as the configuration file saves your latitude/longitude
location.
   In order to make the APRS cursor default to your location when you load
the MAPLIST.xx that you use for your area make the following changes to
the first two lines in the MAPLIST.xx file:

```
28.8775 , Default LAT DEFAULT
81.318  , Default LON startup
```

Change the numbers above to YOUR latitude/longitude coordinates in decimal
degree format (mine are 29.08881 and 80.93507).

   To convert degrees/minutes/seconds to decimal degree format use the
   following calculation:

   To convert 80 degrees, 56 minutes, 6.27 seconds

```
   Divide the seconds by 60:                6.27/60 =  0.1045
   Add the result to the minutes:    56 + 0.1045 = 56.1045
   Divide result by 60:                     56.1045/60 =  0.93507
   Add the result to the degrees:   80 + 0.93507 = 80.935075 decimal deg.
```

With the change to MAPLIST.xx file the cursor will default to your LAT/LON
coordinates and when you enter your house on the map all you have to do
is enter "I", "M" and since your LAT/LON will already be correct, just
press ENTER, ENTER then select "B" for building and "Q" for QTH.

429. PUT YOUR TOWN ON APRS

From: Wb2ngz@aol.com
Date: Mon, 19 Feb 1996 13:57:07 -0500
To: aprssig@tapr.org
Message-ID: <960219135707_426310840@emout04.mail.aol.com>
Rendered body type: text/plain

When I first started using APRS I found that my town "Daytona Beach" was
not shown on the APRS maps so I used the following method to add "Daytona
Bch."
to my USAseast.map. You might want to use the same procedure to add your
city to APRS if it's not there already.

To put the "Daytona Bch." label on the USAseast APRS map. Load the
USAseast.map file into an ASCII word processor (The USAseast.map file can
be found in the APRS\MAPS directory). Add the following line to the end of
the file
(in the label area):

Daytona Bch.,29.11,80.99,256

   "Daytona Bch." is the label to be printed on the USAseast.map, "29.11" is
the
latitude for the label in decimal degree format, "80.99" is the longitude in
decimal
degree format and "256" is the range at which the label "Daytona Bch." will
appear. Enter the data exactly as shown or it won't work. Make sure you note
the commas
and the periods and don't confuse one with the other, it won't work. Do not
try to
use the name "Daytona Beach" instead of "Daytona Bch." The program will only
recognize 12 characters in the city name and "Daytona Beach" is 13 characters
long...count em'.
   Now when you load APRS and zoom into the Daytona Beach area you
will see "Daytona Bch." on the map when the USAseast map loads.

Sorry to have to put it this way, but W3IWI is *SEEING* consistent 50 ns
accuracies using L1 C/A code on a 6-channel receveiver.  Check
ftp://aleph.gsfc.nasa.gov/pub/tac (if I remember correctly).

I guess I'm as familiar with SA as anyone, and more familiar in its
implementation than some.  Your numbers are reasonable, but your 150 meter
degradation is in error.  the 95th percentile number is 100 meters, with an
RMS error over precisely 24 hours of zero. plus or minus sommon mode noise.

> The typical timing output from a GPS receiver consists of serial data plus

The "edge" depends on the manufacturer.  Some use leading edge, some the
trailing edge.  Check your docs: your mileage may vary.

One should recall that in determining time, only one satellite is required,
and observations are made over a long integration period, effectively negating
SA.  If one were to apply digital filter technology (Kalman, 7th-9th order)
one could well eliminate most all of the effect of SA, accepting the
relatively constant computational delays.

Gerry

On another front... How go the elephants?  We had some minor (well, major)
data problems with Trial 2 of Cows In Space, but thanks to Bob, that's
settled.  We're looking at Trial 3 in about 3 weeks, if all goes well.

Congress did pass a law requiring them to do this, but there is a
loophole. This date can be extending if prior to this date DOD provides
congress with a timetable for R&D of an alternate jamming method. There
is no limit on when this R&D needs to be completed, so if DOD says we'll
do it in 10 years, they don't need to turn the SA off. What do you think
is going to happen???

Thanks for pointing me toward Tom's work.  His "Totally Accurate Clock" is
described on the Internet at:

ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/announce.tac

Tom points out that indeed Selective Availability does affect time
accuracy, but these affects can be reduced by averaging the timing data
from all of the satellites that a receiver is tracking.  He uses a Motorola
PVT-6 receiver with timing option A.  This particular receiver does the
required  averaging to mitigate the effects of Selective Availability on
timing.

I would also like to see mk100v20 make more maps at a time.  But with the advent
of WinAPRS and its MacAPRS map translator, we also need to be able to have the
mkmap tool series generate maps with an unlimited number of points and segments
without blowing up.  Admittedly, the DLG data isn't the best as far as
completeness is concerned, but with the ability of WinAPRS and MacAPRS to
display maps far in excess of 2000 points, we also need a generation tool to use
with the DLG data to match them.

Any takers?

> Hey Gerry, how about a short synopsis of the Cows in Space program? I mentioned
> that at an APRS presentation to one of the Utah clubs and got a huge reaction
> about it. I'd love to have some more details for future shows!

OK, you aske for it. On 24 Jan 1996, we instrumented 16 cows with Motorola GPS receivers, PacComm TNCs and Tekk radios. We also put identical packages on 2 fence posts that have the benefit of having been surveyed to sub-centimeter accuracy (WGS-84/94). These serve as checks on both the GPS SA dither and to use for post-processing data inputs to reduce the realtime-corrected DGPS data for better than 5 meter positions.

9 of 16 boxes on the animals and 1 of 2 fixed stations worked. We're trying now to determine the failure modes on all the bad boxes. We were able to get a total of 12 cows and both fence posts going after 24 intense hours of work and substitution... but no realtime troubleshooting

The differential reference station used was a Trimble 4000SSi Geodetic Surveyer talking to a PacComm Wireless Economy Modem (commercial Tiny-2) and driving a Tekk KS-900.

The entire system was painstakingly tested one box at a time on the night before the group left for the La Copita Research Area.

We got 4 days (about 92 hours) of data from the cows and fence posts. We discovered some interesting glitches that I thought I'd tested.

1. The 80 yard and even the 30 foot position filters are much too granular for our study. That's our fault for not determining it earlier. It's a good idea for most folks' APRS use.

2. The NMEA log prior to v 75 is actually a GPGGA log. We changed to GPGLL sentences to decrease airtime and get more precision (a whole digit, corresponding to about 1/2 meter resolution). We didn't get much data. As soon as the test sentences were overwritten with real data, the NMEA log stopped recording data. THIS HAS BEEN FIXED and (listening, Bob?) *IS* WORKING AS ADVERTISED.

3. With only superhuman work I was able to reconstruct the logged data from the APRS .hst files for the entire period and apply the post-processing routines via spreadsheet (it's not sophisticated, just effective).I was able to get comfortable with the idea of 0.9-2.4 meter error (more or less) using that approach.

4. Because of the filters, we had a lot of lost datapoints in the track histroy files. Cows, you see, move forward a step, graze straight ahead, graze left, graze right, swish their tails and then move another meter or less. Takes them a long time to move >30 feet (10 meters) and a REAL long time to move 80 meters. We lost all our dwell-time data because I had not adequately tested the NMEA log, which would have generally given us timing data as well as positioning data.

5. We backed off from 15 second updates per cow to 1 minute per cow with 5 second updates per RTCM DGPS update. We had relatively few collisions and will continue this next time.

6. For Trial 3, I will be telling the fence posts to send a GGA sentence with both time and position integrated (as well as a good indicator of DGPS

activity) at 15 or 30 minute intervals, while the cows will be asked to send GGA sentences once per hour in addition to their GLL updates on a minute by minute basis.

7. As a monitoring tool, APRS was wonderful. Once animal managed to dislodge the instrument package. The grad student was able to look at the pasture map and drive right up to the package for retrieval. Another animal went down to calve. Mother and son are doing well, and we know when she went down and where!

I think that's about it. I do not want to send out track history or map data 'til after Trial 3 and an abstract have gone in. After tha, it'll be available for review. I intend to submit an abstract to the Institute of Navigation on this one.

442. APRS TIME SYNC

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Mon, 19 Feb 96 19:12:43 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.824775163.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

The following a 'long' message about the TIME stuff..

I like the conversation that has been brought up by this topic because there have been MANY good points made by a bunch of different people, and nobody has come out yelling at anyone else.. Most of the points made have been well thought out and presented quite nicely...

However... I think some people might be missing the point..

In MOST cases, people with computers at home/base stations do a 'pretty' good job of keeping their clocks correct..

If they have GPS's, it is even easier, because APRS (both MacAPRS and PC APRS, and soon, WinAPRS) can set the clock from the GPS..

The issue that was ORIGINALLY brought up was that a group of people were out in the field working on a special event, presumably with lap-tops/portables of some kind.. These (at least the older ones) quite often loose time, especially if they have been setting around for awhile not being used (who wants to use an 8088 lap-top when they DON'T have to? hi hi)

The PROBLEM WAS:

The people on participating in the special event ended up with DIFFERENT times on DIFFERENT computers.
At the END of the event, when they tried to collaborate all of the data together, the time differences goofed them up..

The REQUESTED SOLUTION WAS:

They would like a way to be able to SELECTIVELY sync all of the clocks of the PARTICIPATING people to a SINGLE clock..

They did NOT request:

The ability to FORCE their time on everybody else!

Then, some other people said:

"NEAT, You mean I can sync MY time to YOUR GPS/(or other ACCURATE Time device), WITHOUT spending MY money myself? NEAT!!!

So Bob and I have had several rounds of discussions on this, some on the SIG and some in private e-mail..

What we have come up with is a (currently evolving) protocol for a computer with a KNOWN GOOD TIME to be able to send that time out over the air.

All APRS stations that are listening, obviously RECEIVE this packet, but UNLESS!!!!!!!! the user has SPECIFICALLY chosen to SYNC THEIR computer to this time packet, the software just ignores it..

Now, the problems come up as follows:

How many times has this packet been digi-peated before I heard it?
(The software can tell by where the * is in the stream)

How long did the ORIGINAL packet sit in the TNC before being xmited?
(Nobody knows, and this is a problem)

How accurate is the time that was actually sent?
(well.. now that IS a good question)

To solve the ORIGINAL problem, (see WAY above), it didn't matter if the time was CORRECT, as long as EVERYBODY PARTICIPATING was in REASONABLY close agreement.. IN WHICH CASE, the problems above don't matter..

I personally can see some advanced Balloon Tracking applications that might want this...

Second Problem..

How ACCURATE is the time being sent...???

Well, in general, it has the potential of being much more accurate than some of the OLDER clocks in 286's etc...

Yeah, so it MIGHT be anywhere from 5 seconds off to a minute or so..
Oh well... BUT THAT IS STILL BETTER THAN CLOCK DRIFT OVER A MONTH!

Now, how do WE (Keith, Mark, and Bob) resolve this..

Well, we make it so that the time that gets sent is as accurate as possible, and make it DIFFICULT for the end-user to send a WRONG time..

We make the RECEIVE end USER SET-ABLE ONLY, i.e. NOT automatic, and the default is ALWAYS NO!!

We put some 'common sense' into the program, and make it ignore data that is out-of-line... i.e. MORE than xxx time from our 'current' time..

Does this solve everything?

No....

In Computer Networks, MANY MANY MANY computers sync over EtherNet, EtherNet can have LOTS of collisions and delays, yeah, I know it is in the fraction of a second realm instead of many seconds, But... The computers quite often need to be within a couple of seconds, or stuff can get messed up.

In the AX-25 world, we are lucky if the computers are within 10 minutes..

So, the solutions presented will by FAR be better than that...

And in the case of the Cleveland Road Rally, they will have a solution to their original problem... Not, the solution to the common cold...

> The real question is, How do I pull the RANGE and PPI numbers out of
> thin air? Is there a rule of thumb? Thanks for the help.

WB4APR REPLY COMMENT: Sounds like a great technique. Here goes:

1) ALL you need to get your map perfect, is the LAT/LONG of your ORIGIN (0,0 in your numbering system) and the PIX-PER-DEGREE which establishes the scale

2) You simply find two LATITUDE tic marks. If they are at 123 and 456 on your map, then the difference is 333 of your "pixels" equaling the difference in latitude! If the TIC marks are one degreee apart, then your PPD is 333. If they are one "minute" apart, then your PPD is 60*333 or 19980 PPD. I suspect your answer is somwhere between these...

The CENTER and RANGE of an APRS map has *NO* relationship to anything
mathematical about the map. It is just the eyeball center of interest
and it is listed in the MAPLIST to tell APRS when to use this map.

*** HOWEVER *** we are trying to standardize most APRS maps to stay
within the numeric values of 0 and 1024 in Latitude and 0 and 2048 in
Longitude since my COMPRESSION algoriothm can use numbners within those
limits. A SIDE benefit of this standardization, is that you can pretty
well guess the center of the map based on its ORIGIN and its PPD...
The center will be at 1024,512 and the range will be about 32768/PPD.
(but you need to convert these to LAT/LONG and MINUTES(miles) to put them
in the MAPLIST.

For those of you who purchased a Peet Bros. U-2000 before 1996, you may wish
to call Peet Bros about the manufacturing defect that they experienced with
the Temp/Humidity sensor.

The sensor and the cable junction box will be replaced (free I'm told).
Temp, humidity and barometer are inaccurate with units that were shipped.

That's good to know!  I ordered my U-2000 upgrade in late December and got it
in early January.  The Temp/Humidity accuracy has been pretty bad, off by
as much as 10 degrees and 40%.  But the barometer seems quite good, usually
within .01" or .02", compared to readings from NWS 8 miles from my QTH.

At the risk of flogging the subject to death...

If you set FULLDUP ON, the the packet will get transmitted as soon as the
TNC sees it...if the channel is busy, there will be a collision, but no
bad time will be receieved...perhaps sending several clock messages a few
seconds apart would increase the chances of everyone that is listening
getting a packet...They still could get hung up in the digi though.

Several people have questioned me about the conditions on the
congressional mandate to eliminate SA, here is the text from the 1996
budget...

 SEC. 279. GLOBAL POSITIONING SYSTEM.

       (a) Conditional Prohibition on Use of Selective
     Availability Feature.--Except as provided in subsection (b),
     after May 1, 1996, the Secretary of Defense may not (through
     use of the feature known as ``selective availability'') deny
     access of non-Department of Defense users to the full
```

capabilities of the Global Positioning System.
(b) Plan.--Subsection (a) shall cease to apply upon
submission by the Secretary of Defense to the Committee on
Armed Services of the Senate and the Committee on National
Security of the House of Representatives of a plan for
enhancement of the Global Positioning System that provides
for--
(1) development and acquisition of effective capabilities
to deny hostile military forces the ability to use the Global
Positioning System without hindering the ability of United
States military forces and civil users to have access to and
use of the system, together with a specific date by which
those capabilities could be operational; and
(2) development and acquisition of receivers for the Global
Positioning System and other techniques for weapons and
weapon systems that provide substantially improved resistance
to jamming and other forms of electronic interference or
disruption, together with a specific date by which those
receivers and other techniques could be operational with
United States military forces.

Subsection B sure sounds like a big loophole to me!

A GREAT idea. Of course all digi's involved should also be full-duplex
digis, if possible. The APRS software could remember the current state
of the FULLDUP setting, set FULLDUP ON (if it's not already), send out
the TIME PACKET, and then restore the original FULLDUP setting (if it wasn't
already full duplex).

Collisions will occur, but if the TIME PACKET is sent rarely,
all other stations subscribing to the TIME PACKET service should
sync up within a few transmissions, and everyone else, who are
following half-duplex CSMA rules, will hopefully not get too upset.

It's really not practical to change the digis to fulldup just for the time packets, and leaving them on fulldup would be a huge mess. In the setting which people seem to want to use the time protocol, most stations would probably be in direct range of the time station. If it has to go thru a digi there will be a loss accuracy, but this isn't designed for precise needs.

Oh, I *meant* that the digi's should actually BE full-duplex, not half-duplex digis with their TNC's set with FULLDUP ON. If the digi(s) in the path are half-duplex (e.g., operate on the same freq. for input and output), then we're back to the original problem and will just have to live with it.

Here in Europe probably the vast majority of the 70cm (where most of the packet activity takes place) digipeaters are full-duplex with the standard (for Europe) 7.6 MHz freq. split, so the FULLDUP ON idea might work very well here. I don't know how many digis in the U.S. are full-duplex. But even if there are not many, I agree that the "time standard stations" could be chosen such that all stations can hear *a* time standard station directly or at least not through any half-duplex digipeaters.

ASZ@aol.com sez:
>
> gerry, I might have overlooked it, but why are you tracking the cows?

Smart-aleck response: Because they paid me to.

Research answer: Texas A&M University and the Texas Agriculture Experiment Station received a USDA grant to investigate animal-land ecology interactions, with particular interest in the migration of ticks (especially the Lone Star tick) on cattle. The cattle-tick problem is a $250 million/year issue for the beef industry in Texas alone, and led to the original quarentine of Texas cattle in the 1880's when the big cattle drives swept north. Although we have been pretty successful in controlling ticks in this country, Mexico has not, and a quarantine region near the Texas-Mexaco border still exists.

We're looking at several things:

1. Forage patterns of the animals on pasture and mesquite thicket at different growing periods of the year, including drought/winter and wet/spring and summer

2. Dwell times in foliage mots where the animals might acquire ticks

3. Animal preference for several different types of mesquite thicket to pastureland reclamation (for years, PhDs have been telling ranchers, "This is what the cows prefer," describing a variety of reclamation methods. We have 5 different methods represented on the pasture we're grazing. For the first time since they started giving PhD's in Range Science, we're asking the COWS, rather than the PhDs, what the cows like best)

4. Roughage and nutrition capability of the pasture at various growing phases

5. Roughage and nitrogen utilization of the different types of forage, and at different growing seasons

6. Herd sociodynamics (how long it takes the cattle to return to normal grazing patterns after being handled, significant for future studies)

7. Proof of concept for this type of tracking system and development of refinements

>Bob Busch
>WB3KXJ
>Laurel MD

I have an MFJ-1276 which does 300/1200 packet, pactor, and fax - it's a nice and
relatively inexpensive compromise (I paid $139) and can also be upgraded with
MFJ plug in higher speed modem options.

I also have a PK232, which I love. Don't limit yourself to packet only - there
is much fun on the other modes!

I have been very happy with mine, the only drawback I have found is the symbol plotted by APRS is tied to the character sent in the position string, rather than the ssid of the mim.

469. Looking for a low cost GPS

From: "Bruce W. Martin" <martinbw@telalink.net>
Date: Tue, 20 Feb 1996 15:45:14 -0600
To: aprssig@tapr.org
Message-ID: <9602201545.AA14684@oscar.telalink.net>
Rendered body type: text/plain

I'll try this again since William Nolle, KE4EER told me it was blank the first time I sent this.

I am looking for a low cost GPS receiver for a standalone tracker I am putting together. I have a low cost transmitter and am considering the MIM module or a used KPC-3. I saw some mention of $100 GPS receivers in a message. I don't need a display just serial output and an antenna.

TIA

Bruce, KQ4TV

Out of curiosity, has there been any interest in a query - response mechanism.... rather than blind broadcast mechanism ?? By that I mean, the "master" (and any station can call itself the master) asks specific "slaves" (and likewise - if it is queried then it is a slave) for their position... or the wx at that location... or the DF cut direction..
or ??? whatever....

This might allow a "round robin" query of info... like in a directed net rather than arbitrary blind xmsns.... also would allow multiple "events" to use the same "freq" without all xmsns cluttering up screen - ex. emergency response personnel being tracked independently from racer positions....

just a thought.... maybe allow high dynamic query of race leaders.. while only infrequent query of end of pack positions....

Just a thought....

472. MapEdit v1.1

From: Jan Barglowski <jan@archimedes.vislab.navy.mil>
Date: Tue, 20 Feb 1996 17:53:23 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <199602210153.RAA04634@archimedes.vislab.navy.mil>
Rendered body type: text/plain

Hello All!

I've recently updated the MapEdit program to read in USGS DLG data. Along with reading the data, it also reduces the points automatically. MapEdit is available at:
  http://www1.ridgecrest.ca.us/~jan/me/

MapEdit's features include:
- Total manipulation of every map feature, point, and label.
- Real-time pan and zoom of the map.
- No point limit, although things do get slow after 10,000 points :-)
- USGS DLG Read, with ability to pick which objects to read, like trails, railroads, streams, etc.
- Automatic "joining" (aka chaining). This joins features "straight", so that the thinning routines are more efficient.
- Vector-based thinning routine to eliminate needless points. This can be adjusted by the user to perform extreme thinning.
- 5% radius increase, if desired.
- Can use the entire APRS 2048x1024 area to draw the new map inside, rather than 640x350. This gives smoother features at high zoom.

In the future, I'm thinking of adding a USGS "gridding" option, to let the user enter in a center, starting radius, ending radius, and let it crunch all night.

>From just my own notes and comparisons, I've noticed MapEdit can make a map with 10% fewer points then other USGS maps I've generated. And this is all automatically. If you were to use the MapEdit functions to further move and delete points you could probably get another 10%. Of course, everyone's map is very different so I only claim this for maps I've done...

MapEdit runs using the Tcl/Tk language, and has been tested under a few of the SGI and SUN machines we have. Once the TIX extension (used to open files and other miscellaneous features) for Windows is released, it should run under Windoze, too. Please go to the Web page for more info...

WB4APR REPLY COMMENT: You can pretty well do all of what you request simply by proper operator setup in any fiven net.

1) You can already Query any station individually with the QUERY command. All other stations naturally default to the 15 minute rate, and this allows you to query the ones you want. So if you want a queried net, just tell everyone to set to 30 minute reporting, and Query the ones you want.

2) Already, multiple things can share the frequency. Set ALT-SETUP-MODES-SPECIAL and all such stations will only see themselves. BUT everyone else can watch them...

3) Select ALT-SETUPS-MODES-ALTNET and only those ALTNET stations will see themselves, and NO ONE else will notice them unless these monitoring

stations set CONTROLS-FILTERS-OTHER.

4) Set up to send your packets to any other NON-APRS TO callsign and no one will see you. Set CONTROLS-FILTER-OTHER ON and you can see them. Use BUDLIST to filter out all APRS traffic

SO, LOTS of ways to do everything you ask using the flexibility built into APRS and into every TNC...

Southern California has an excellent (and growing) APRS presence on 145.79 which can right now cover most of the route from Santa Monica to east of San Diego. By summertime, I expect that the coverage will even be better, with added high-level stuff to improve coverage. It will be tough though, once you go east of Jacumba as there's no activity from that part of eastern San Diego county all the way to Phoenix. Strategically placed machines at the top of the west escarpment of the Imperial Valley (Mt Laguna, Monument Pk, etc) and at Telegraph Pass east of Yuma would extend the coverage all the way to about 100-150 miles from Phoenix. What's going on in Arizona?

When coming back into California from Nevada there's currently no coverage from LV all the way to about Barstow, then there's some coverage on 145.01? into the central valley.

Greetings,

I have been watching your demise for a while now. Sounds identical to the problem I was having with tpk a couple of yrs ago. I found that the baud rate was at fault. It appears your computer is not talking to the tnc..
Same thing I went through.. I had baud rate set too low for the program even though both the tnc and computer were set the same. As soon as I set the baud up to a faster pace everything communicated.. I would go over your baud setting on both the computer and tnc again.. Maybe just maybe ...Hi..:-)

Regards....de Steve VA3HOI

I'd like to use those neat new maps... But for some reason once I "M C" to the "FTW" extension (Maplist.ftw) or the "TX" extension (maplist.tx) the screen goes blank (shows only APRS dialog boxes) once it calls the Dallas map up.

I even tried to "*" comment out the TXDallas.map, on the FTW and TX maplist files... No luck. Anyone have suggestions?

```
On Monday, Feb. 19 Larry Griffin asked:

>I've heard that the DOD is going to turn off GPS SA
>May 1, 1996! Is there any truth to this?

 On Monday, Feb. 19 Steve Dimse replied:

>Congress did pass a law requiring them to do this, but
>there is a loophole. This date can be extending if prior
>to this date DOD provides congress with a timetable for
>R&D of an alternate jamming method. There is no limit
>on when this R&D needs to be completed, so if DOD says
>we'll do it in 10 years, they don't need to turn the SA
>off. What do you think is going to happen???

     I think you hit the nail on the head, Steve.  But
let me put in MY two cents (for which I expect to have
my head handed to me!)

     While we no longer live in a world in which we're
scared about the rooskies blowing us to kingdom come,
there are still plenty of loonies out there who'd just
LOVE to lob some black-market ukrainian nukes at us.
So despite the obvious advantages shutting off SA would
be for you and I, Joe & Jane Ham, I must disagree with
what amounts to giving away some of our (and I know
you're going to groan at this one) national security.

     I think the question is this: Does the average ci-
tizen actually NEED the accuracy provided by undiluted
GPS positioning?  If the difference is "only" 300 feet,
is that (not including projects such as cows in space,
and other business and research work, for which allow-
ances have already been made) REALLY crucial to you and
me?  While it's nice to track something (or yourself)
with such precision, I'd rather sleep better.

The distributed maplist was cloned from the maplist.tx and maps from
CMAPS03.ZIP. There is also a
TXMAPS01.ZIP file and this may be where the modified Dallas map came from.
You could copy the
maplist entries for the 15 maps and insert them in your maplist.
Sorry.

While gps may be an affordable toy for yourself, a large percentage of
units are in the hands of citizens who rely on them as an aid to navigation.
In low visibility conditions the difference in accuracy can become a life
or death issue. Returning to port without seeing either side of the harbor
entrance is something I have experienced but not enjoyed. Accurate gps
positioning also means that we can now use the gps as an anchor alarm.
No prudent navigator relys on any one device but there are times when you
may have to gamble your life and the lives of others on your best card.

Doug, the name of the utility is GRABBER, which, I think is on TAPR.

You can do the same thing (almost), if you have Windows. Start Windows, start APRS within Windows. Bring up a map you want, then hit "ALT-Prt Scrn". The image will go to the Clipboard, then you can go to Paintbrush, or a Gif viewer program within Windows, paste from the clipboard, and save it the way you want.

To which end you've missed a point. Differential correction is available with relatively low cost solutions for reception. If your requirement for precision is such that you would benefit from removal of the SA-induced error, I suspect you would be much better served by DGPS wherein the errors are corrected on the fly. It also offers you better accuracy than de-dithering would.

I can take either side of the SA on-off issue. However, if you do not understand the limitations of common mode navigational and positional error within the system and the preferential methods for countering it, you should not discuss just how much better your track histories will be with SA off vice on.

Gerry

Hoo boy! I knew I was opening up a can of worms. My earlier posting was obviously MHO, and I humbly and publicly concede to your arguments for shutting off SA before this thread gets out of hand.

As I operate APRS from my shack, not mobile, and don't own a GPS unit, I was expressing an opinion based on looking in from the outside. I can now see some of the many advantages of having such accuracy and thank those who posted all those responses for your experiences. 73

PS: I got my exact latitude and longitude from DeLorme Street Atlas USA V. 3.0, which is accurate to 1/100 minute, and doesn't seem to suffer from SA dilution 8-{)

Just to start an argument.....

As a part of the recent (current ?) discussion about SA being turned off, Gerry wrote:

"Differential correction is available with relatively low cost solutions for reception."

That is correct, as we all know. The US Coast Guard transmits correction data for boats; the FAA is talking about transmitting correction data for aircraft; and in most cities, you can subscribe to a "MUZAK"-like service for the data.

HOWEVER.... If its so easy and cheap to "defeat" the supposed security of SA, what good is it ? Are you trying to say that a terrorist won't use differential correction because its "spoiled ?" I'm sure that that is NOT any kind of deterent. Besides, there are a LOT easier and cheaper ways of delivering ANY kind of device... HE, nuclear, or CBW, than with an airplane, or boat with GPS controlling an autopilot.

Much more importantly, why are two government agencies spending goverment dollars to UNDO something that another government agency is doing ???

I think that the problem is that technology has overtaken the original system design. In the late '60's, when originally designed, GPS receivers were expected to be VERY expensive and complex. The military could afford them because they had to. Civilians certainly would not. That's VERY far from the reality of today. The rules changed, but the bureaucrats didn't!

  Differential is only available in selected areas. If one is in a area
where one must use a suscription service it is by now means low cost. In
addition having to now rely (purchase) two receivers does improve
reliability.

  That sounds like just so much technobable Gerry. I'am well aware of the
limitation of gps accuracy having the opportunity to use gps plotting on a
real USGS chart while observing my position over long periods of time, but
that does not alter the fact that most mariners like myself will enjoy
an improvement by a factor of one 95% of the time without SA. May I remind
you of the incident of the tug towing the barge which hit a bridge in low
visibility which caused the wreak of the amtrack train with loss of life.
One of he conclusions of the NTSB board was that if the tug had accurate
gps positioning this incident could have been avoided. I don't wish to
engage in an offtopic debate on this and do not intend to reply to your
response but I could not resist presenting my opinion.

What does the Temp/Humidity sensor have to do with the barometer? I
bought my U-2000 before Xmas, but did not buy the outside temp/humidity
sensor. I have noticed NO problems whatever with the barometer (whose
```

sensor is inside the indoor display unit). Can anyone else verify this
claim that the barometer is inaccurate with untis that were shipped prior
to Jan 1, 1996? I don't get the connection between the two sensors..they
are completely different devices and located in two housings (one inside
and the other outside).

Frankly, I'm kind of curious too!  I also bought only the upgrade kit for
the U2000.  I use the existing temp senosr without humidity.  I guess I'd
have to say I don't really know if the barometer is accurate.  To be honest,
I don't see a correlation either.

For all interested in the U-2000 inaccuracies...

I experienced probelms with OUTSIDE TEMP and OUTSIDE HUMIDITY
as others on the SIG have noted. BAROMETER tracked ok  with info put
out by the Weather Channel and local airports. The Barometer is
UNAFFECTED.

I called Peet Bros and the nice lady said early TEMP sensors never
received a coating of protective spray so it will be replaced FREE. The
early HUMIDITY sensors required a capacitor in the junction box which
it didn't receive. On demand, PEET is replacing both sensors FREE but
```

```
at NET 30 cause they want the inaccurate devices mailed back and if
they don't receive them in 30-days, you'll be billed for the NEW sensors.
Mine are already pack up and will be mailed before I even get their
replacements.

I have dealt with PEET BROS on several ocassions and I have nothing
but good things to say about those folks. They stand behind their products.

There has NOT been any problem with the barometers in Ultimeter 2000s.

There WAS a problem with some of the early outdoor temp/humidity sensors and the junction boxes that were ordered before the end of '95.

The temp/humidity sensors did not have conformal coating on the sensor leads and were subject to errors caused by condensation between the leads. To avoid this problem new sensors are coated after the leads are soldered.

The junction boxes were allowing a small amount of AC coupling to feed into the sensor, causing temp readings to be a few degrees high. This was resolved with the addition of a bypass capacitor.

Both items are being replaced free, provided you return the original parts within 30 days.

Hello All,

I am new to APRS (2 wks old), and just have a quick question.

When I manually input WX reports in APRS75, I enter W-E and put in my report.

I notice that it changes my Posit and Beacon lines. It removes my old beacon text and enters the Comments field from WX, and my posit line only contains WX info.

Is there a way to keep my original posit and beacon lines and enter WX reports (i.e. R000/T000.....) as well?

I have to currently change them back manually. And if it has anything to do wirh it... I am not currently a registered user (as I said, I am new to this aspect of packet).

TNX!

PKZIPFIX should come with the pkz204g.exe package. Try the following steps,
and see
if it works ... If not, you can contact me via email , and I will email you the
program ...

Try this if you can't get a good copy of WMAPS07.ZIP ...

At a dos prompt, type "PKZIPFIX WMAPS07.ZIP" then press enter.

This will create a file called "PKFIXED.ZIP" .. Try unziping that. That should
solve your problems.

I have just used Command-Shift-3 for the last 12 years.   :-)

When you upload files to TAPR APRSSIG upload area it might help if
you also upload a .txt file telling what it is. This way the file
house cleaning file robot might not remove it.

This radio was in discussion about 3 months ago on the SIG. I published
the MAXON specs here and there was a lot of discussion. However, not a
single order was placed by anyone.

Does anyone want the specifications again? Contact me directly.

The southeast and south has had a great 2m band-opening all night. Here in the
Florida panhandle I've got 80+ stations from South Florida, Georgia, Alabama,
Tennessee, North Carolina, South Carolina, and 5 or 6 stations in Texas (some
of whom I've heard direct)!!! Band openings are pretty frequent here, so
it's not that big a deal, but...I have NEVER seen any APRS stations in
Louisiana and Mississippi on 2m!!! Where are you guys?

Jeff Ward, N4TRY

Hi Larry:
I am trying to use the U2000 in the remote mode, as I did the U2.
When I first set it up, it locked up all the local aprs users software, and
since it was going thru a gate, I suspect it locked up stations all over!
Needless to say, it is now only beaconing, and not transmitting data, until
Bob has the software bug (DOS error 6 I think) resolved.

Gerry,
A little on the sharp side maybe? How are we Dummies going to
learn if you don't help us? I too thought that if SA was turned off then
I could get 50' accuracy. In reading some of your messages I gather that
is not quite realistic.
In your "spare" time (between 3 and 4 in the morning) could you
explore some of the other options that you refer to?

I tried to convince my XYL that the reason I NEEDED a GPS was to
get locations of repeaters for my "job" as repeater frequency coordinator
of Wisconsin.
        I too have started using "Streets & Alleys" <Street Atlas, USA>.

        Did you here about the Racine, WI repeater whose coordinates
placed it in the middle of Lake Michigan?  About on the WI-MI state
line on a line between Evanston and Benton Harbor......  Or the Wausau, WI
repeater that SA tells me is actually in a suburb of Detroit?

        You'd (we'll I do anyway) think that with all of the location
information available they could do better than that.

Do you mean     ^^    "Streets & Alleys" or "Selective Availability?"
You state that SA is giving you totally bogus locations, but it's not
clear which "SA" you're talking about here!

Just posted NEWFIX22.zip.  It has all new things since version 7.5:
Remember to always use PKUNZIP -d so that everything goes in the
correct directories...

* MAPFIX22 fixes the TASKS-IMPORT command so that the import matches
  the white border
* Includes USAswest.map which was omitted from 75 distro
* Includes a new COlorado.map that replaces the old CODenver
* New backup files for the Olympic Torch run.  TORCHw.bk and TORCHm.bk.
  The East coast files are not finished yet.  These files can be LOADED
  or RPELAYED so you can see the 15,000 mile route of the torch all
  across the US.  Whether or not we are successful in getting APRS
  officially in the entourage, please be sure you have adequate digi
  coverage in your area, both into and out of town...!

REMINDER:  MAPFIX menus are all new, plus I finally changed the aspect
ratio to match the PC screen.  Be sure to tell me if I broke anything.

APRS75 distro significanlty re-arranged my big MAPS, and which maps are
in the various E, W, M, C and SE distros.  Be sure to do the MAPS-CHANGE
to your maplist.  Then, if the map selection and overlay does not work
in YOUR area, please tell me. I cant zoom in everywhere to see if I
screwed something up...  I need your feedback...

WB4APR REPLY COMMENT:  The problem is that every now and then the U-2000
may output a NEGATIVE wind direction.  This will crash any APRS74..  It
has been fixed in APRS75.  So plese put it back on the air.. BUT to a
minimum UNPROTO path until everyone has a chance to upgrade.  Do NOT go
via GATE. thanks.

I don't know specifically was electronic connection there is between them.
But I do know that N3HPR had inaccurate baro, humidity and temp readings.
He is only 3 air miles from the Erie Airport and has good reference.  When
he contacted Peet to complain, one of the Peet Brothers talked directly to
HPR and said there was a manufacturing defect and said that all three were
affected.  HPR's junction box and outside unit have been replaced and they
are now accurate--including the barometer which now tracks exactly with the
NWS at the airport.  It was formerly, as much as .10 high or low.

Boy you guys have fire in your pants.  You're shooting the messenger who
carried the bad message.  There was no condemnation of any kind in my
message.  It very matter-of-factly stated that Peet was correcting a
manufacturing defect.  Free!

Why would you:

1.      Not believe me and question the accuracy of my message on the SIG,
when all you had to do was call them and confirm it?  And get your new parts!

2.      Assume that I had some malevolent purpose, when my message was
intended to benefit many individuals who, by reading this SIG, I know
received their U-2000's within the defect time frame.  And many of whom, I
suspect, did not realize that their units were giving false readings.

Therefore, I shall refrain, in the future, from telling you anything that
will benefit you and you may stew in your inaccuracies.

Thanks to those individuals who e-mailed me thanking me for calling this to
their attention.

To: aprssig@tapr.org
Message-ID: <199602221828.KAA00063@poseidon>
Rendered body type: text/plain

Attn: ULT2000 Users..   Filed: 221620GMT FEB 96
Have reviewed most all ULT2000 sig msgs back thru Dec 95. Of all comments, suggestions and gripes, do not recall seeing any mention of the APRS programs POSrate capability. (ALT-S-POSrate) we have had the commands and control in front of us all the time, and mentioned in the WX.TXT file of README.DIR ..

Normally set up: ALT-S-POSrate: (Comes 30/540)

1. Enter desired GPS/LORAN/WX/DF screen refresh period in secs (30 ? ...
Set it to 60 or 120 or 180,, wx data from Ult2000 will be outputed 1, 2 or 3 minutes...to your APRS screen (center top) every 3 minutes on mine. .

2. Enter transmit period for your GPS/WX/DF packet in secs (540)?
So the actual WX packet is sent every 8/9 minutes. I set mine to 900 so the WX packet updated every 3 minutes is sent on air as a packet data every 15 minutes.

Comm-buffer-overloads. If you set your #1 refresh period correctly, and send your one line msgs, check your P or L (Position, Beacons screen) or add weather comments (sky coverage, visibility, wx remarks) in your BCN text (ALT-B), WITHIN THAT UPDATE PERIOD, you will not get COMM-BUFFER-OVERLOADS.

If your sending one liner msgs back/forth, and do get a (comm-buffer-overload), then break break the data circuit from U2000 to APRS Com port 2, reconnect after second or two, and you back in buisness, no sweat... I'm connected by DB-9 plugs, I just unplug (to break circuit) and replug em and "AWAY WE GO". Or build an off/on switch in the data circuit and throw the switch, "Conductor." !!

Also set Ult 2000 in the "DATA LOGGING MODE" , or try the other 3 modes and you'll see what happens.. No Problem, they don't work into APRS...

For Bob/APR... If can change program to act like a TNC and if data being sent by APRS, have the ULT act like a TNC and wait 1 or 2 seconds if circuit busy, before it sends its updated WX info to go out as a packet wx xmsn. Or however you can do it, i'm no programmer , just a suggestion.

As mentioned, new ULTIMETER data program version to be released soon, per Peet Bro. tech Bill...
73's & Enjoy, Bill/WB6LPG@KA6EYH.#NOCAL.CA.USA.NOAM.//

The 2m band opening made it briefly into St. Louis, too. I saw one beacon each, direct, from an Alabama and a Georgia station on Tuesday evening. Both were WIDEs, so probably they had some manner of enhanced power/height. They were just ID beacons with no position report, so they only showed-up in the heard list; I had to go to the Callbook to see where they came from.

Because they were single packets and I saw no repeats, I was wondering if it was meteor trail propagation. Given these other reports, though, it's now

```
clearer that the front moving through was responsible.

Mr. Bruninga, WB4APR

     I mailed a letter to you today with $14 to register the APRS74E
software version I have for use with a Trimble GPS.  What I would like to
ask you is to let me know what my original APRS Shareware Registration
number is.  It got lost last summer when I moved from the Pentagon
(Arlington VA) area here to Holloman AFB.
     I originally registered with you at a Little HamFest next to NSA and Ft
Mead MD either late fall 93 or early 94.  You called my wife latter the same
day and gave her the registration number, but as I said it was lost last
summer.  I would appreciate it very much if you could locate it for me.
     I am working on a demo project here hopefully using your software that
if successful I feel will expand its use in the Holloman area.

     It was fun to meet you and to see how far you've come with this good
idea.

     Thank you very much

It happened in Missouri, too! I logged the Edwardsville, IL, WIDE (N9PPJ, if I remember right) on VHF that evening! I've also been seeing VHF stations up through Iowa today! The APRS users around here have several WIDES already set up and they don't NORMALLY talk to each other 100%, so when I see N0GGU, N0BKB and points north during the day I know that we're having a band opening....

We're sitting on a stationary front that runs right through KC today but will move east tonight...

I feel I must rebutt this message, for I was one of the stations responding.
Sorry if the originating station felt offended... my intentions were to
CONFIRM what he had written on the SIG with an actual replay of a
conversation I had with PEET BROS.

I was not shooting any messenger nor were the other replies that
resulted. I think it was Mr. Henderson that has misconstrued our replies.
We were augmenting your information not condeming it.

Well George i'm not going to do that (Surprise). I don't realy know why there is
no activity there, it's strange tough how a whole state is not participating in
APRS, but then again we have some 1400 hams in our county alone with
only a few participating in APRS even tough our local packet system is going
down the tubes.

Well! Did I miss something here? One SIG member uses the phrase "nothing but
good things to say about", and I concur with my own excellent experience of
the company concerned. And we both get this?
I've never been too fond of this "shooting the messenger" business in the
past, but I can see it's an awfully easy habit to acquire....

Well, the band was open again last night.  Same states as the night before,
except this time got a few more stations from South Florida.  Texas came in
good early last night (Thursday).  And we can add Kentucky, Ohio, and
Illinois to the list of stations seen.  I checked the digipaths on these
stations and none of them have "GATE" in them...so I assume they're not
coming in via HF-VHF gateway (if I'm wrong please correct)!  That's quite a
stretch from the Florida Panhandle!  What a great propagation study tool.
Where else will you find so many stations on the same VHF frequency?!!! Nice
job, Bob.

Jeff, N4TRY

P.S.  Band is still open at 9:04 AM local time...

Well, yes and no. i have found that you MUST enter an 8 digit filename to
start with or it will chrash. But all in all it has many many bugs. I don't use it
myself because of that. I also have lot's of problems with Bob's latest mapfix
program, i just find it to hard to use with the new menu system. i couldn't
even figure out how to draw a line Hi. I found also that with the 100k2a as
you call it that the last map in the series always crashes and therfore for the
last map i always have to use the TEMP file for the last map. Like i said in a
message i posted a few days ago i don't understand that with maps being the
main product in APRS (Let's face it it wouldn't work without maps) that so little
time is spend by programmers to refine that software. I wish i knew how to
write programs i would do it myself, but since i don't i just have to sit back
and hope someone else will. There is a program written by another Ham called
MAPEDIT but it requires you run Linux, so to many this is not useable either.
Hopefully Keith with Winaprs will someday include a good mapmaking program.
Altough i hope that the map background color with the Winaprs will be either
selectable or will be something other then white, us older folks can't see the
lines on the map like that!. Anyway i hope this will enlighten you a little to my
mapmaking problems Hi.

> That is correct, as we all know. The US Coast Guard transmits correction data for boats; the FAA is talking about transmitting correction data for aircraft; and in most cities, you can subscribe to a "MUZAK"-like service for the data.
>
> HOWEVER.... If its so easy and cheap to "defeat" the supposed security of SA, what good is it ? Are you trying to say that a terrorist won't use differential correction because its "spoiled ?" I'm sure that that is NOT any kind of deterent. Besides, there are a LOT easier and cheaper ways of delivering ANY kind of device... HE, nuclear, or CBW, than with an airplane, or boat with GPS controlling an autopilot.

We have beaten the delivery methods and systems down before. I'm not going back into that area.

You are not defeating the security of GPS and SA with differential correction. You are, instead, utilizing the methods delineated by appropriately appointed committees to improve the utility of the GPS system for non DoD users. One reason most of the unwanted users, assuming they're not locals, would be unlikely to use a differentially corrected signal in an attack is that they would be unlikely to be able to get high accuracy corrections easily since they not know where to go... DCI and the (appropriately identified) MUZAK sources notwithstanding.

> Much more importantly, why are two government agencies spending goverment dollars to UNDO something that another government agency is doing ???

Because they're not. They're following mandates to improve the utility for civilian users without tampering with the basic system. There is a significant difference.

> I think that the problem is that technology has overtaken the original system design. In the late '60's, when originally designed, GPS receivers were expected to be VERY expensive and complex. The military could afford them because they had to. Civilians certainly would not. That's VERY far from the reality of today. The rules changed, but the bureaucrats didn't!

In many respects this is true. However, GPS system enhancements (space segment) are continuing to evolve and experiments are being undertaken to improve the spoofing and jamming resistance of the space segment hardware. The ground segment will also benefit from this over time.

A common misconception is that by turning SA off, you'll get Precision Positioning Service accuracies immediately. Not so. C/A (Course Acquisition) levels of location accuracy remain at 15-45 meters for non-dithered conditions, and are a function of a short PRN selection, a low chip rate and use of a single frequency (L1) for all determinations, rather than using L2 for code and carrier phase correlation. DGPS using the Radio Technical Committee for Maritime Operations (RTCM) Special Committee-104 (SC-104) protocols for mapping grade corrections, can improve SA-affected errors by an order of magnatude (~100m > 10m resolution) while it can similarly improve non-dithered data to something on the order of 3-7 meters. The lack of improved resolution is a functionof several common mode errors inherent in the system. These improvements are only apparent over baselines between base and rover of about 300 km, with your best corrections witihin 40 km.

Use of the Real Time Surveying (RTS, formerly RTK) protocols defined by RCM SC-104 allows for long baseline datacollections and resolution of carrier phase integer ambiguity allowing you to resolve a bseline slope distance to sub-centimeter accuracies. Please note: This is not a GPS Lat/Lon/Height, but a chord between a known base station and a rover, with both collecting data for 20-30 minutes continuously.

Hope this is somewhat more informative.

gerry

Differential correction is available in coastal areas on LF/MF from the USCG. The price of a Beacon receiver is not insignificant, I'll admit. And I agree that the broadcast subcarrier services are a bit high (or worse) for their services.

> response but I could not resist presenting my opinion.

Having seen the GPS plotting errors will give you some feel for the limitations of the system. Knowledge of the techniques involved in adding SA dither adds to that appreciation.

The fact of the mater is, you can expect about a factor of 3 improvement with SA off, assuming your comparison is worst-case SA to best-case non-SA. You will appreciate a 2x improvement most of the time... sometimes a bit less, sometimes a bit more. As to the claim that your improvements will be appreciated 95% of the time, I guess the orbital mechanics just escapes me. Further, not knowing either the receivers or the algorithms used to determine when to search for more satellites is unknown to me for your receiver I can't have too much of an opinion. We'll agree to disagree on this, somewhat subjective, topic. OK?

I'd have to examine the entire premise of the NTSB finding. I suspect they were looking at results of some of the Houston Ship Channel high-speed ship DGPS trials, using RTS corrections, and Trimble 4000-series receivers for real time extreme accuracy positioning. One should really be leary of making a blanket claim that one technology or another, especially one subject to the laws of physics in a manner such as GPS, would have prevented a disaster such as this. I do suspect that GPS could have helped in their navigation. I'll reserve judgement on just how well they could have navigated that channel in the dark and fog with non-corrected, and non-dithered, GPS.

Regards, Gerry

I agree! I have been driving a lot in GA and FL and am frustrated that there are no stations or digis South of Atlanta (save for ZGL in Macon) unti you get to Tampa, FL. , an almost 8 hour drive. Tampa/St Pete has Kevin and his GATE as well as a couple of others, and there's a digi in Lakeland. The Digi in Tampa is deaf and the one in St Pete is kinda low, I hear.   There is new activity by a young crowd in Orlando, a little in Daytona I think, and a user I saw in Cocoa Beach. There's lots in Miami ("where everyone's a wide") and that Is all I saw.

Fort Myers, FL: Ha- the packet gurus there have their latest "new thing": A new Chat Node.

But... I try to spread the APRS gospel wherever I go!

To: aprssig@tapr.org
Message-ID: <960223204416_331301206@emout04.mail.aol.com>
Rendered body type: text/plain

Well I'm sure the entire sig wonders what happened to the guy who's always headed for the beach.... eaten by a large shark, captured by the Swedish Bikini Team, burnt to a crispy critter because he fell asleep and forgot to roll over???? No actually, I'm enjoying the challenge of a job search in the Pacific northwest. I'm completing my military career (same as retiring) and believe it or not, hoping to move from Paradise to lovely Washington state, targetting the Spokane area.

FYI, APRS is growing in E. Washington, and can be found on 145.75 (careful, 145.79 is a simplex voice repeater system with long range link to Portland). APRS there is being led by Jim and Ann (WA7RVV/WA7ROS) who have put a nice system of mountain top remote WX stations/digis linking Spokane to Portland via Yakima. Nice system. I was able to track west from Spokane to the Columbia River crossing on I-90 north of Yakima, and did several one liners with Jim and Ann's son, N7QXO, in Portland. I'll be making changes to the Yakima and WASound maps to reflect the track histories.

Back in western WA now, Seattle area, and no sign of APRS activity here. I understand there is some activity south, near Puyallup, where KB7QQQ and gang are trying to invoke participation.

Anyhow, the job search continues. I'll be heading back to paradise next week, after a brief stop (maybe Wednesday - Friday Ken/W7KKE) in the SFO area, and you can all bet that soon as I get back to Hawaii I'll be heading for the beach, and may even take along a bagel. Aloha. Dave.

545. PKZipFix (PKZ204G.exe)

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Fri, 23 Feb 1996 20:25:00 -0800
To: aprssig@tapr.org

Message-ID: <199602240425.UAA09875@poseidon>
Rendered body type: text/plain

All PKzipper's...   Filed: 240404GMT FEB 96

   To all who responded to my search for the PKZipFix program, thank loads
for your replies and info..
    I found the whole PK files in the TAPR_Library files under Utilities.
"
However upon unzipping the program it has CRC errors:
  Inflating: PKZIP.EXE PKSFX: (W15) Warning ! file fails CRC check.
:/ PKZ204G.EXE has errors!
PKSFX: (W17) Warning!
Authenticity Verification Failed!
One or more of thsese files has been tampered with!. "

So I went to the ARN Annapolis BBS (N3JUY) 1-410-280-2503 and found the
PKZ204G.exe file and downloaded, no problem full 17 files on the P.K.
program and all the exe files.. Worth lookin at.

  As for the two area maps, WMAPS07.ZIP, and CMAPS09.ZIP, they both are
defective with CRC errors, especially the CMAPSPO9.ZIP is totally corrupted
with CRC errors. WMAPS07.ZIP only a few CRC errors, but some files no, none, zip
bytes, lists the maps names, but 0 for number of bytes in the file. Hi..
  Did not fine these map ziped files on several BBS's , got them only from
my local KA6EYH APRS BBS, so where, how, why, they got polluted don't know.

  Area Map Coordinators please check out these 2 zipped map files for
origination and where they were first sent, see if originals have the CRC
errors.
   Check'd what I had for Viruses, and they were clean. Anyone else have pblms
with these files ????

Message-ID: <199602240707.CAA43474@osceola.gate.net>
Rendered body type: text/plain

Don't forget the West Palm Beach area Ralph with 3 WIDE's (appropriatly spaced!)
and a handfull of users with GATE's on 30 and 80 Meters!

JUST OFF THE PRESS!!
Naples is now "on line" with some APRS users, just chated with one during
another opening here. A digi is going up in Okeechopee (Not Okeechobee) to the
south of them for a link into Miami/Homestead in the next month or so. Word has
it that one of the locals is on 10.151 but I have not seen him due to skip.

As far as the real band opening goes tonight I printed several WIDE's in AL and
GA and even one station driving arround N2NEQ-2. Yes the bands are still good,
wonder if anyone got lucky on 50.62 APRS ??

Message-ID: <199602240711.CAA48306@osceola.gate.net>
Rendered body type: text/plain

>What was the GA call?
>
>I have the N4NEQ-2 and -3 digis

>>N4NEQ-2, Ralph. It was you. ;-) The Alabama station was N4KMJ-7.

This is also what I saw, all of the above and a little more. It is now 2am and

BTW 30M is still open into 0 land and VE2.

As far as the paths go, I saw Ralph both DIRECT and thru the digi's so none of this 200ft digi to 1300ft digi link stuff! This was the real thing with my 30ft high antenna.

Message-ID: <199602240727.CAA07412@osceola.gate.net>
Rendered body type: text/plain

THings are catching like wildfire down here in FL, both for real and with APRS!

What ever happened to the APRS-ROSE thread, did everyone give up with ideas or is Tom in some corner writing code waiting to surprise us ?? Has anyone ever contacted G8BPQ over on the other side of the pond to see if he would support APRS??

A really interesting article just came out in QST this month on Packet CLusters. I have always thought their network arrangement would do well for APRS if it could be integrated into a UI type system. I also do know that they are VERY active in the Law Enforcement field for mobile data and gateways to the NCIC2000 system, wonder if they would be interested in helping or are they too big now.

Right now we are faced with a problem in FL where many populated areas are growing in APRS activity but are just a bit too far for 100% reliable paths. Some areas are too small and users get bored and disappear, if the pockets could be linked this would not happen as often and systems would continue to grow. The other problem in making a WAN is that even if the link is there a path of 5-6 digi's is needed to reach the final point. With the channel usage going up like our temperature we need another way to pass the bulk of the long distance traffic and maintain our 1200 baud outlets. The best thing is a choice of local communications (stay on 1200 baud VHF) or WAN coverage over to another band on 9600 baud and take big hops via dedicated links with no need for a huge UNPROTO string to increase your collision rate and failures.

Ok, lets hear it all, I am trying to heat up the fires again on purpose!

Hi all!

Waz wondering if anyone knew how to use the track log on the garmin 45 to 'plot' a road on a map. It seems to me like it should be possible, some how, but I have not been able to figure it out. I'm running MacARPS here. Been fooling around with it a little...but still no luck. Do I need some sort of map editor or something like that?

-Jack

Rendered body type: text/plain

```
The Pompano Beach Medical Center relay will be on line today.
The final antenna installation will begin this morning.

The original plan was to make it a WIDE-RELAY, but since another
club has installed a WIDE, we'll just make it a relay  and a backup
for that station if needed.

Local South FL USERS !  PLS READ !!

WE are planning on installing a wx monitor at this location.
With support of some local users, we can pay for it.
I am chipping in $150 bucks.  IF anyone on the sig (in South Florida)
would like to help with a donation, we can make it a community project.
The device would remain at the medical center.
IF your in South Florida, and your reading this, you know where to find
me !!
Watch for the machine to go on line today.
Also, my 30 meter gate has been operating 24 hrs a day for the last
2 weeks. The MFJ loop antenna is working like a champ. Ive qso'd with
stations from Columbia to California- Mexico boats to Canada.
I highly recomend this antenna.  Mine is at about 45 feet and is vertically
oriented.   The rig is a ICOM 706.
Mike    KD4EMI@AOL.COM

It's possible that whoever got them to the EYH BBS obtained them from an
Internet site and didn't specify binary format before transfering them.

This is very embarrasing to have to ask, but how do you get rid of manually
entered WX short of quitting, and restarting ?  I entered one yesterday in
response to unexpected dense fog, etc., and then could NOT get the thing
removed! when conditions improved.   Ended up dumping and reloading APRS.
 There HAS got to be a different way, but I couldn't find it.

Also, we have a station that entered one several days ago, screwed it up,
and can't get rid off it either.  He's tried, and I've tried to help him get
rid of it.  No luck.

Thanks,
Donn

558. Ult2000 & ver7.5 & winaprs2.4

From: rkramer@cdx.net (Ronald Kramer)
Date: Sat, 24 Feb 1996 22:06:57 GMT
To: aprssig@tapr.org
Message-ID: <312f86eb.70939780@mail.cdx.net>
Rendered body type: text/plain

An observation here...

I have a u2000 here and it works
very well with winaprs 2.4 on outgoing using the data
logging mode to send rs232 to the computer from the u2000.

Aprs 75 decodes this info from winaprs2.4 ok.

I have not tried using the u2000 with aprs 75 yet as I can
not use com4 irq 11 for inputing the u2000 with aprs75.
Com 3 and 4 will only work with irq 4 and 3 , which means
that I have to share irq's with com 1 and 2 that use these
irq's and I do not whish to do this as my tnc is on com 1
and my mouse is on com 2 and these are unmovable , as the
tnc has to be on com 1 or 2 for it to work with aprs and the
mouse has to be on com 1 or 2 to work with windows 95.
That means that the u2000 has to be on com 3 or com 4.
The u2000 work on com 4 ok with winaprs 2.4.
When KE2VW Greg hooks up his u2000 to a paccom tiny 2
in standalone mode, and uses data logging mode which
is the !! prompt my aprs 7.5 decodes it ok and prints it
on the screen. On the Winaprs 2.4 it does not decode this
string when it comes in over the air, it does decode ok if it is
input on the rs232 direct from the u2000.

If he uses the packet mode of the u2000
which sends out the $ult string then aprs 7.5 locks up
and gives an error 6 I beleive and has to be rebooted to
get back on line.

I hope the above observation can be of some help in
determining the U2000 string problems...

Equipment here is Pentium 60 mhz with 16mb ram
trident 9440 vesa bus video card, window's 95 release ver.
I have 4, 16550 com ports set up as :

```
com 1  irq 4        address 3f8       ns16550an
com 2  irq 3        address 2f8       ns16550an
com 3  irq 5        address 3e8      ns16550an
com 4  irq 11      address 2e8      ns16550an

Regards, Ron ...                            73 de Ron

Some additional info to supplement Rich's message....

The Collier County (Naples FL) APRS effort will include a 30m/2m system at
the County EOC, using a WIDE on 2 at abt 150 feet.  We hope to put
another at OCHOPEE (about 6 miles east of SR 29 on US 41) abt 45 miles
east of Naples.  Propagation to the HST digi and W4EHW (NHC) should be good.
The Ochopee site will be at about 100 feet, and will tie Naples to the
lower east coast and the keys.

KG5QD and I hope to put these systems on line in the next month or so.
We're working on a power supply and have to burn some eproms...then do
the actual installs.  Will advise the SIG as things develop!

```
As most FL APRS users know and quite a few others, Brothers To The Rescue (BTTR)
fly the Florida Straight and Gulf Waters looking for Cuban rafters. If found
they notify the USCG and send water/flares out the window for their wait.

Recently they have begun some "political" missions but things turned for the
worse today. Russian Mig fighters shot 2 out of 3 BTTR aircraft 20 miles NORTH
of Havana, well into International waters. Reports also say that BTTR boats were
also in the area and got rammed by Cuban Coast Guard cutters. The ramming
happened a few months ago also so this is not "new" but Migs have made their
presence "known" in the past, this time they actually destroyed the 2 aircraft.

In recent months KB4TFF-7 has not been seen flying search missions, Osvaldo Pla
KB4TFF was one of the injured at the last boat ramming while he was operating
KB4TFF-8 APRS. One can only guess why the APRS operations had ceased, can Fidel
be listening in on 145.79 also ??? Who knows but I am sure it was a good
possibility and who want's their coordinates, SA or no SA being sent while in
flight with Mig fighters well within radio range! It is unknown if any licensed
amateurs were on board either of these two planes today but most of their pilots
are licensed.

Please Pray for these pilots and their families who's condition are unknown. We
do not have any confirmed rescue or recovery reports yet but a USCG Falcon Jet
did report earlier that 2 oil slicks were spotted in the area but no debris or
survivors. At 19:30 EST it was reported a USCG Cutter was on it's way but ETA
was not until 23:00 Hrs EST!! I do not know why it is taking so long to get a
watercraft into the area but by what I have heard so far and knowing the high
volume of Sharks in the area we can only pray.

     Your question deals with a mapping application. Recommend that you post
it to the Usenet Newsgroup    <sci.geo.satellite-nav>
     For the past week I have been reading s.g.s-n to get some understanding
of make and models, prices, usage, etc., and found the above newsgroup to be
very helpful. Yesterday I bought a Garmin 45 and am  wandering around the
simulator mode as described in the manual.
     Two other newsgroups that you might find helpful are:
       <sci.engr.surveying> and  <rec.autos.4x4>
          Arthur, N1NHZ, 73
In 1996, Volunteer Amateur Radio Operators will be supplying communications

On Sat, 24 Feb 1996, Ronald Kramer provided some detail on the U-2000:

> in standalone mode, my friend used data logging mode which
> is the !! prompt and my aprs 7.5 decodes it ok and prints it
> on the screen.
>
> If in stand-alone mode, he uses the packet mode of the u2000
> which sends out the $ult string then aprs 7.5 locks up
> and gives an error 6

WB4APR REPLY COMMENT:   Aw shucks.  If APRS gives an error 6, the
offending packet should still be visible on the bottom line.  Can you
send me a copy of that string?  We are finding that the U-2000 appears to
occassionally output values not totally within its specified values
(such as the negative wind diretion... that we fixed in 75)   Until
someone captures the offending packet, I dont know what to fix.
Good detective work so far, thanks, cant wait to see the bad packet...

2) I had forgotten that APRS would accept a data logger mode off the air.
THanks for that report! (But the TNC must them be placed in GPS mode)
```

Rendered body type: text/plain

```
Hello Folks,

     It's been a while since I've fiddled with some of the APRS "details"
     and I'm having trouble getting a Wide digi we're setting up downtown
     to show up on my map at the home station! I know I've seen this before
     on the sig, but can't remember where or when. The digi beacon is as
     follows:

     !3052.88N/08059.74W#PHG5390/WIDE-RELAY

     The receiving TNC is a PK-232 and it seems like I remember that the
     problem is the way the 232 is set up, but for the life of me, I can't
     get it to show up! The beacon is making the trip with no problem, but
     I can't get it to show the symbol on the map. I'm sure it's something
     dumb on my part, but I'd appreciate any ideas.

     Thanks,
     Card Smith, N4FOR
     Savannah, GA
```

I hope that the pilots are safe and that everything will turn out fine, BUT
that's an international incident and I'm curious what our governments response
will be!

Rich has a point about broadcasting position reports!  As close as the FL boys
are, it wouldn't surprise me if he wasn't right about the Cubans monitoring
145.79!!!  Let's just hope that out APRS operations haven't contributed to this
situation...

In the meantime, I'd be curious to know what the recent "political" missions are
that Rich refers to...

>
N9QGS QUESTION:

I thought when the manually entered weather is entered it is date and time coded
and when another APRS station recv it, if its already old, It would be
grayed out or ignored.  I am just wondering, Cause there was a time when I
would
manually enter weather, and I would enter it and then maybe 3 days later I would
enter a new reading.  I hope other stations were not thinking my obs were
recent.  I think Manually entered weather should be transmitted no more than 45
minutes after it has been entered,  I am not sure how MacAPRS handles this,
But I think the APR version changes the TNC Beacon, cause I know I have turned
my TNC and it had weather paramaters in there and would send them even though
they are very old.

The BTTR flights recently have not used APRS for position reporting
recently, so APRS is not involoved in this incident. In fact, BTTR
recently removed the WIDE from Marathon, much to my chagrin. The
political nature of recent flights has included incursions into Cuban
airspace, including a flight over Havana a couple months ago. There were
reports of leaflets being dropped, but I never heard if that was
confirmed.

While I do believe in their cause, I think flying a light plane over a
major city of a hostile country is not a particularly bright thing to do.
I do hope they are OK, but it doesn't sound like their chances are good.

I agree! Sounds like BTTR's been had! It was, unfortunately probably the prudent thing for them to stop their APRS presence, but in this case maybe it would have saved the lives of the pilots?

I'm still hoping for their eventual recovery and safe return home, but it doesn't sound/look good at this point!

Without intending to step on any toes out there....Is BTTR now affiliated with the CIA? Why would a humanitarian mission (is it church sponsored?) be involved with such a potentially lethal activity as dropping leaflets over Havana in the first place????

Sure the U.S. want Castro out and Communism gone from the western hemisphere but from what I've seen on the news over the past couple of years it would seem that Fidel has been softening and, given his age, probably won't be able to maintain power for many more years. Perhaps if we'd leave them alone the Cuban Communists will lose power on their own. The nature of the communist regimes is such that, eventually, they WILL fail and the people will abandon the communist system. Russia was the lead example. Let's face it, Castro is off on his lonesome now. A little "discrete" CIA intervention might be the catalyst to finish the job, but having civilian, humitarian workers do the job is CERTAINLY not appropriate, IMHO...

OK, enough of this on the SIG. It's really not an APRS/WinAPRS issue, is it?
Let's just all pray that the pilots be found safe and sound!!!

Hi All

I've been reading the messages relating to Gerry's cow tracking project with interest.

I thought you might be interested in a similar project which was done at the University College of North Wales, Bangor, in the late 70's.

The project was called the Bangor Orange Position Estimating Equipment for Pastures (BO PEEP), and came under the guidance of Prof David Last (GW3MZY). The object was to track the course of a sheep, at the request of the University's department of Agriculture.

A technology called "Orange Tracer" was used, this was used at the time for tracking data buoys etc. This involved down converting the "Orange" frequency of the Decca Navigator system from the VLF range to an IF in the audio range. This audio signal was then transmitted over a UHF link to the decoding equipment, at a fixed location. The "Orange" frequency could be used for positioning as it contained sequential transmissions from each transmitter in the chain.

I'm sure Prof Last could oblige with further information if anybody is interested.

Pete Baston GW0PJA.

Anyone one interested,

Agrelo Engineering and Associates are conducting WinAPRS & DFjr tests on 145.090, this digipeater has very large coverage and is located on Crawford hill in Rotterdam, NY. I have noticed stations recently loging on from Texas and other places in the US, but before I had a chance to log all the stations I was seeing, WinAPRS crashed on me, I had 3 map windows open, station list, history list, & message list when I clicked on one of the maps, poof I lost it all.

Mark Sproul has posted detailed maps of our area at
ftp://aprs.rutgers.edu/pub/hamradio/aprs/

ALBANY
GLENSFALLS
AMSTERDAM
GLOVERSVILLE

if anyone is interested in watching or participating in the action.

Hope to see you there

If you don't live in South Florida it's hard to understand to furvor of the anti-Catro movement here. People have been murdered, homes and businesses firebombed, for even suggesting that the US normalize relations with Castro. I think BTTR started as a humanitarian effort, but last year when the policy on rafters was changed, they found themselves with nothing to do (the policy worked, very few try to cross the Florida Staits anymore). They seemed to gradually become more polical, and began with the fly-over and leaflet programs. The government made it very clear in the press down here when they first started doing incursions that these flights was not supported by the US, and that the US could not and would not protect them if they entered Cuban airspace. My best guess is they once again flew over Havana, and got tagged going out. They knew what they were doing, and I think maybe they wanted to be shot down, to become martyrs.

WB4APR REPLY COMMENT:

Yes, they are stamped with the date and time, which will not change.  SO
as the report gets older and oldder, people will know..  But like any APRS
info that is not changed, it will continue to be reported until changed.

Hi Guys,

        N3KAE, Al, WX3A, Ray, and myself WM3L did an APRS presentation
at last weeks club meeting.  It turned out better than we could have
imagined.  First of all, we had the largest turn out for a meeting in a
long time.  But best of all, one of the locals guys WA3LWR, Bob who does
alot of packet set us up with a site, radio, tnc and power supply.
Temporarily we are trying to get it up on the mountain as KD3GG-13.
When we get a new X-1J chip burned it will be K3CSG.

Anyway, we will be at 2100 ft ASl and 655 feet HAAT in Northeast PA.  If
anyone sees it please let me know via e-mail

Thanks...Bernie WM3L  berlyn@epix.net

Well, I hope that I haven't, inadvertently, stepped on anyone's toes re my
comments on possible CIA involvement with BTTR.  I read two articles (from AP)
in the Kansas City Star this afternoon and got some interesting insight into the
anti-Castro business in FL.  I'm all behind that, too!  I'm just sad when
well-meaning people get hurt/killed in trying to work with a political agenda.
In the case of BTTR, though, it would appear that they may have gone too far,
sadly.
```

I laud the effort of BTTR in working to make sure that boat/raft refugees are found, supplied and rescued; I'm just not so sure that flying over Havana or, as the article stated, "that while details are murky, early indications suggested the planes may have been heading to Cuba to land, pick up people and fly them out of the country" was a prudent move!

The AP Article further stated that U.S. Customs officials were questioning the returning pilot (a Jose Basulto, head of BTTR) at the groups headquarters at Opa Locka Airport in Miami. It further stated that "Basulto was under investigation by the Federal Aviation Administration for violating Cuban airspace in the previous flyovers."

Apparently BTTR was warned by Castro after a July 13 (1995) flyover that any aircraft that violated Cuban airspace risked being shot down.

God, I can't believe I'm about to say THIS: Hooray for Clinton's condemnation of the attack. While others are saying that this is an act of war, if a U.S. aircraft did indeed violate Cuban airspace in spite of prior warnings to cease one can understand why they were shot down...

That DOESN'T make it right, though! A more appropriate response would have been for the MIGs to take the aircraft into "tow" and escort them safely out of Cuban airspace as any other reasonable government would have done!

I suppose that time will reveal what the U.S. response to this act will be. In the meantime, I will continue to pray for the families of the pilots and hope that the pilots will be found safely!

Well, I suppose, as I've said previously that it really doesn't have to do with
APRS DIRECTLY, but BTTR was using APRS and in a very serious manner up until
about a month ago. In a way it IS APRS-related, but then, again, it's not
either. Kind of a grey area I'd say...

The one thing it DOES point out is the POTENTIAL negative uses for APRS. Who's
to say, as Rich pointed out, that Castro's military hadn't picked up a copy of
APRS and had been monitoring the BTTR operations? There's a LOT to think about,
guys and gals.

This may be a "wake up call" for us to exercise a bit of prudence as we all work
to get APRS spread to all our friends and neighbots. It also brings to mind
another issue that has been tossed about this week: the impending shut-down of
SELECTIVE AVAILABILITY!

Is it possible that DoD (in its omnipresence) was already aware of the use of
APRS and GPS units with BTTR? If not, surely they are by now after the
government finishes interrogating Juan Busalto! Could this operation and its
unfortunate results be used as an argument in Congress to continue the Selective
Availability process?
Probably...

We may be on the "cutting edge" of this entire issue, ladies and gentlemen!
Personally, if I were a congressman and not familiar with amateur radio and the
technology and the DoD came to a hearing and gave testimony in front of me
citing the BTTR incident, I'd be voting to repeal that Selective Availability
measure REAL quick! Of course, I'm not BUT the average congressman WOULD most
likely react this way....

More food for thought....

Is this appropriate discussion for the Sig NOW?

Best 73,

584. Wide HF/VHF gateway

From: JAgrelo@aol.com
Date: Mon, 26 Feb 1996 09:24:16 -0500
To: aprssig@tapr.org
Message-ID: <960226092414_333317662@emout08.mail.aol.com>
Rendered body type: text/plain

Yesterday I posted a message that I was seeing APRS packet from around the
country including Texas. Before I was able to log what I was seeing WinAPRS
crashed on me for the first time. Someone localy informed me that NY2U had
set up a HF/VHF gateway, I don't know what frequency he was using yet, but as
soon as I find out I will pass it along so others can watch us do live

```
WinAPRS-DFjr test.

For anyone local, the digipeater is on 145.090 (for now).

Rendered body type: text/plain

```
Hi all,
I just received my Peat Brothers stations and I am trying to best
configure the system.  I am running os/2 and I leave APRS up 24 hours a
day.  Com 1 is the TNC, com2 is the mouse, com 3 is flexible and com 4 is
the modem. (All 4 com ports can be used at the same time as they have
unique interrupt levels, ie: com3 is IRQ 11 and com4 is IRQ12)

Since APRS will only support com 1 and com2, I would like to be able to
tie in the Wx as well.  I can't move the mouse (unless os/2 users have
found an update that will allow the mouse to be on com3).

Does the Ultimeter send WX continuously so we could use some sort of HSP
design cable?

Ideas would be appreciated.

cheers...mike

I have been using the garmin 45 w/ a registered version of garmin64. This
     windows shareware program allows uploading/downloading of waypoints,
     tracks, & routes. The program also allows you to view track data in
     graphical format (your road perhaps!). Also, each type of data (waypoints,
     tracks, & routes) may be edited in the garmin64 editor, plus in ascii file
     format using your favorite text editor.

     I used this program to map out my "goose hunting lease" this past year
     (independant of aprs).

Hi all!

Waz wondering if anyone knew how to use the track log on the garmin 45 to
'plot' a road on a map. It seems to me like it should be possible, some
how, but I have not been able to figure it out. I'm running MacARPS here.
Been fooling around with it a little...but still no luck. Do I need some
sort of map editor or something like that?

Does anyone have detailed maps of Colorado in Mac or WAPRS
format? I downloaded both Mac and WAPRS from the the
Sproul WAPRS server, and found nothing useful, only central
states outlines. At least with what I found the DOS APRS
maps are MUCH better. However, our local Edge of Space Sciences
baloon group has Mac maps from somewhere. Does anyone
know the source?

I am trying to hook a Garman 45 up to TNC and computer
using HSP cable. Does anyone have a wiring diagram for the
cable provided by Garman as connected to a female DB9 plug?
The red is power, the black is ground, the brown is GPS
serial out and the white is serial in, but what pins on the
DB9 are the white and brown connected to? This unit will
be used as a tracker without the computer most, but not
all, of the time.

Yes, Mike, the Ultimeters from PEET outputs data constantly and can
be configured just like standalone GPS trackers using KPC-3's etc.
The U-2000 has several output modes... check the docs. Lots of wx
stations are running standalone with no APRS or computers... just a
wx station, TNC, and radio.

This still applies to HSP though as you mentioned. Just substitute your
U-2000/500/II for a GPS receiver and set APRS to "sample" that port
as often as you want to...

So many ways, eh?
Have fun es 73

Rendered body type: text/plain

```
The following was stolen from usenet news:

5) Just recently the effect of SA appears to have been reduced. We are
now seeing 40 meters 2Drms. It is unlikely that SA has been turned off,
only turned down. We can fruitlessly speculate over what will happen to
SA tomorrow and next week. Troops in Bosnia with civilian receivers?
6) Excellent evidence of GPS error behavior is in the error graph
on <http://www.cnde.iastate.edu/gps.html>. The site operator is
generously
furnishing daily statistics of horizontal fixing at 1 minute intervals.
Those of us who have been using our receivers as GPS monitors can now
surrender them to more constructive purposes by simply consulting that
site's error plot. Yesterday's error looked like 35 meters, 2Drms, to
me.

  Check out the excellent GPS web site.

```
I've borrowed a KPC-3 for an upcoming APRS event, and the kind fellow who lent
it was not able to find the addendum sheet for the GPS-related commands that
came with the upgraded ROM. I can run it fine from the computer, but I'd like
to beacon position reports in those instances the computer is off-line doing
something else.

Can someone give me a quick run-down on what I need to know?

Pending the outcome of final debugging and testing, I should be able to
announce a cross-country APRS "event" in a day or so.

Thanks!

Running out of COM ports on a PC seems to get easier and easier as I find more
things to connect to in the shack.

I have been running 5 COM ports on one of my W95 machines for several months now
and everything works fine. The COM1/COM2 pair are at the standard locations and
IROs; COM 3/COM4 use the alternate addresses and IRQs 5 and 9; finally, I have
the Mouse Systems COM5 card ($29) supporting my mouse at address 0238H on IRQ11.
The board comes with drivers for both DOS and Windows, and there is a free
software driver setup program called FSI (Fail-Safe Installation) available from
the Mouse Systems FTP site. The latter is the best of the software available.

BTW: I have one of those old QuadPort boards (4 RS-232 ports on a single board,
sharing 1 interrupt, I think) from AST. Does anyone know how if it's possible
and practical to set it up to work in a W95 environment? I need more COM ports
for my ham shack machine (lots of TNCs, microcontrollers, and other modems)!

APR COMMENT: True, for a stand-alone-tracker
>
> This still applies to HSP though as you mentioned. Just substitute your
> U-2000/500/II for a GPS receiver and set APRS to "sample" that port
> as often as you want to...

WB4APR REPLY COMMENT: Nope. IF APRS is in HSP mode, it toggles the HSP,
and is told to look for GPS data intertwined with the packet data. APRS
is not looking for WX data on that port.

Using an HSP switch for WX is not easym because at 2400 baud, the data
takes longer and you have a much larger probabliliyt of colisions with
packet data using the same port.

Ok, now I'm confused.  I thought that APRS was "told" if you were going to
use a U-II or similar, and that it expected to see it at the other serial
port.  Hence the separate WX validation.  I tried to use the HSP switch with
a U-II, like a GPS, and the program told me I was real stupid to ask. (don't
say it!)

Now, if you are wondering if APRS will recognize your Peet Wx station on
com3 or 4...that is another problem altogether. From what I recall, Com3
and 4 may be supported addresses in dos APRS, but they use the same
interrupts, which adds essentially nothing. Maybe Bob has hard configured
interrupts other than 4 and 3, but I don't recall it. Further, if he has
hardcoded the interrupts to something other than 4 and 3, and you board
doesn't support those addresses and interrupts, you are SOL all over
again.

<vent spleen on>

What all these software authors need to finally "GET" is that it is the
USER who should be able to specify the address and interrupt that the
program will use. Hardcoding either addresses or interrupts with only two
available interrupts, or four addresses and four interrupts, two of which
may already be in use is just unacceptable in today's multi-tasking and
multiple com port board environments.

Some shareware authors have, indeed, figured out how to do exactly what I
have noted. A fine example is N3EQF, the author of LOG-EQF. Tom
completely rewrote his comm i/o routines to accomplish two things:

1. enabling and making use of buffered uart i/o...this reduces the
   requirements and loading on the main processor.
2. allowing the USER to specify ANY address and ANY irq, thus permitting
   the use of any comm board.

JNOS also permits this same approach.
G8BPQ node software ditto

There is just no excuse for limiting the USER to a 1970's approach,
especially when the programmers all assume they have an exclusive right
to COM1 and COM2 (or if 3 and 4, using the SAME interrupts as 1 & 2).

The PC as it stands, can easily support six serial ports and this has
been done for years...but only by a very few program authors have
bothered to empower the users to make their own choices.

A good example is what I am doing right here, right now:

Log-EQF is running the TS-870s rig control on one port and TNC/Packet
Cluster on another port...neither of which is COM1 or COM2...in fact,
they are at totally non-typical addresses and interrupts, but were
permitted to be specified by ME to fit with MY MACHINE's requirements.

At the same time, I am running two ports of JNOS (tcp/ip) on two other
ports, again, neither com1 or com2. All four ports are on one STB 4port
card.

Com1 and Com2 are completely open, for those damn programs that insist
they know where we ought to run them. This is NOT necessary, not a
requirement of the operating system, not a requirement of the hardware
```

readily available to us, but merely the result of antiquated progamming practices. It's time to get with it, guys, the days of "buy another PC and dedicated it to <fill in the blank, cuz every author has the same advice>"...when that is totally unnecessary. Let's make better use of what we have instead of dedicating another PC.

<vent spleen off> & apologies to anyone I may have offended with my outspoken and strident position regarding the all too common progamming practices of today's software authors.

To your OS/2 mouse question:

If you are using a serial mouse, the utility Rodent will let you use your mouse on ANY available address and irq. It is available on all the "usual" os/2 bbs's, like norloff. The file name is rodent100 or something like that, version 1.00....I know lots of people using it.

>Does the Ultimeter send WX continuously so we could use some sort of HSP
>design cable?

Depending on model...the data rate of the U-2000 in the data logging mode is approximately 90 data sentences per minute. The U-II is about 17 data sentences per minute.

>Ideas would be appreciated.

Hmmm...we'll see if I stirred anything up.

Ditto what Bill/EER has said ref the one posting about APRS involvment in BTTR was enough for the SIG. However, I just came from a job interview with one of those 3 lettered govt agencies, and one current events question was "Do I know what BTTR stood for?". I had not watched the news in a couple days, nor read a paper, but I did see the traffic on the SIG, so was able to ace that question.

Did Cuba over react to the presence of two unarmed C-337 in/near their territorial waters? Yes

Is it of further interest to the SIG, where it's easy to get off on a tangent? No

Do I think Bill deserves the flames he normally gets? What do you think?

Dave, WH6YC. "If I had a beach nearby, I'd go to it"

Still in Seattle for a couple of days. Aloha

Assuming one has an STB 4 port card, with 8 user definable addresses and
interrupts, does Win95 permit defining the com ports on this board? I
recall a special comm driver required for Win3.1 that would permit user
defined com ports, but have seen nothing about Win95...suspect it might
be built in, but have not heard. If you know, could you describe how it
is
 done? (It may result in me buying my THIRD STB 4 Port card, as two of
them
 are now running in my OS/2 machines.) 73,

This is interesting!! My co-worker had 2 GPS units next to each other and they
were both showing very strange readings all of Saturday Morning. We do not know
if it has continued since he does not have the 2nd identical GPS as he did
Saturday AM.

He had been in familiar waters and the readings were quite off, the readings
also varied all the time, moreso than normal. Dunno but funny that one person
sees more aurate reports and someone else has worse almost at the same time!

608. KPC-3 GPS Commands here they are!

From: KE6VRL@aol.com
Date: Mon, 26 Feb 1996 20:50:31 -0500
To: aprssig@tapr.org
Message-ID: <960226205030_432344593@emout08.mail.aol.com>
Rendered body type: text/plain

First the signal ground of the gps must be connected to pin 7 of the KPC-3
the data output of the gps must be connected to pin 2
(Option connect the data input of your gps to pin 3, this is to give commands
to your GPS if it can support them)

1. Set ABAUD to 4800 unless your gps can support different data rates.
2. set GPSHEAD 1 $GPGGA this will store the GGA string in the buffer for
transmit.
3. set the LTP 1 APRS via (insert your digipath here)
4. set BLT 1 Every xx:xx:xx (Insert how often you want to beacon positon
hh:mm:ss)
5. set GPSINIT $PGRMO,GPGGA,1 (if your gps requires an intialization string)
6. finally and most important set INTFACE GPS, and reset the tnc.

This are the basic settings for beaconing positions, there are other
features, but this will let you beacon your posits. This information is from
my experience using a KPC-3 and a Garmin GPS-45. Good luck, Hector KE6VRL.

Yes, Win95 WILL allow the user to custom configure the address and IRQ of the
comport.  Start Control Panel, select Device Driver, double-click on Com1 etc
will bring up the properties for that port.  In Properties you will find the
Settings.  There are about 7 presets for the standard combinations but one is a
user-defined set.  Check out Help in that area to see which one it is for
sure...

N9QGS:
I was wondering I know using the U-II as a stand alone, you couldn't report
rainfall at all, and I was wondering if with the 2000, that is available for
APRS users of there equipment? Or what exactly you are limited to when
using the U-2000 as a stand alone, vs having it hooked into APRS?

Were they showing different position solutions between them? If so, the most
probable culprit is the chance, and a good one, that they selected different
satellites. Were they similar (same manufacturer & model)? And, if so, were
they contemporaneous (same firmware revisions)?

> He had been in familiar waters and the readings were quite off, the readings

Selective Availability can, theoretically, be switched on and off by both area
of coverage and time, and each satellite is diddled independently.

> Seems like I read that someplace...

Correction of SA using DGPS depends on sending individual corrections for each
satellite that are incorporated within the receiver into "corrected"
positions. The data include:

Time and sequence number
PRN (satellite ID)
pseudorange correction
pseudorange rate correction
user range error

satellite health

Obviously, if the DGPS station is not seeing the same birds as you, you're not actually gonna get corrections.

Most receivers perform 3D position calculations based on 4 birds. Some (Trimble, of note) sample multiple combinations of birds and select the best or present an average position, on the fly (over-determination). DoD has been experimenting with selective dithering based on subsatellite point (geographical coverage) and time, as well as some tests where they are trying to "spoof" the birds, which may degrade C/A user performance to an undetermined degree.

Hope this helps.

620. Antenna elevation plotting

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 27 Feb 1996 11:26:35 -0500 (EST)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960227110422.14448A-100000@greatlakes>
Rendered body type: text/plain

I just wrote a program called SIGPLOT.bas which will plot a complete elevation profile of your omni antenna. It uses the RF from the constellation of GPS satellites as a signal source, and any cheap GPS receiver to give you AZ, EL and signal strength! Just scale any antenna design to 1575 MHz and place it outside, hook up a GPS receiver to your serial COM port, and watch the profile develop.

The GPS constellation is a slow moving source of RF that in only an hour or so will provide you with a signal from all angles and elevations (*). Most GPS receivers output a data format which tells you the AZ, EL and SIGNAL strength from all satellites in view. Simply PLOT Signal strength against ELEVATION and in an hour or so you will have a beautiful ELEVATION profile of your antenna. This assumes that your antenna is omni directional in azimuth so you can ignore the AZ data.

SIGPLOT also will plot the simultaneous data from TWO different GPS receivers hooked to COM1 and COM2. I am using this to compare my home made GPS antennas against a known commercial one. It plots the COM1 profile in green and the COM2 profile in red.

This SIGPLOT.bas technique could be very useful to antenna modelers. It can also be used to plot azimuth profiles too, but it will take longer to fill in data from all azimuths AND elevations. * Most GPS receivers have an internal MASK function that makes it ignore satelites below a certain elevation (10 degrees?) but in many cases, this limit is user selectable. Also, you can incline your antenna to be sure that it is pointing towards the direction of the most satellites. People in high latitudes should not expect to see any satellites to the north...

Thank you, Hector! That was *exactly* the information I needed, because, yes, we're running the KPC-3 with a GPS-45, too. I don't necessarily need to get into the other stuff just yet. I take it that to get out of GPS mode on the TNC (to return to APRS, for instance), it's just INTFACE TERM, and then also turn the beacon off.

(BTW, to Jim, KU0G - searching the Web was the first thing tried. Searching for "Kantronics" hit on some sites about software for TNC's in general, but nothing for Kantronics proper.)

> Running out of COM ports on a PC seems to get easier and easier as I find
> more things to connect to in the shack.

WB4APR REPLY COMMENT: No matter how many COMM cards you buy, you will always run out. I finally just mounted a small cigarette size box on the front of my PC and routed COM1 and COM2 to a pair of db-9 connectors. At last count, I have 14 Serial device cables. I just plug in whatever I need whenever I need it. No IRQ's, no software re-configuration, no SETUPS, and I have infininte expansion.

Most programs never use more than 2 ports at a time anyway! Though, I am sure that with MULTITASKING operating system, then you would want everything accessible at the same time. But for my DOS world, it is fine.

```
FYI, especially FLA stations:

Thanks to help from KG5QD we now have the Collier County (FL) EOC on the
air, 145.790, 25 watts at 160 feet basically omni (side mounted
vertical).  It's running WIDE and RELAY.  The Ochopee digi between here
and MIA is coming as soon as we can...as is the 10M port at the EOC.

73,
Gary WB2WPA

Great idea, Bob!  I want to try it!

Just wondering... did you test the patch antenna design that was published a few
months ago in QST?  I built one of these recently and I'm disappointed with its
poor response at low elevation angles.  The gain is more than adequate above 45
degrees, but appears to drop out of sight within 40 degrees of the horizon.
Occasionally, I have trouble acquiring enough satellites for the Garmin 45 to
get its initial fix.

I did make one modification to the published design -- the ground plane on my
antenna is an 8" diameter round piece of aluminum I happened to have in the
junkbox, rather than the rectangular shape specified in the article.  The
"patch" dimensions, feedpoint, and spacing above the ground plane are as
specified.  I didn't expect this mod would make a big difference, but it would
be interesting to compare with the original design.  Of course, I can always cut
the ground plane down to size if it really matters.

Any suggestions for another homebrew design that would have a smoother pattern?

Where can I download SIGPLOT?  It would also be interesting to look at the plot
files you've produced during your tests of various commercial antennas.

73, Mark, N2CHV

628. Ultimeter interface question

From: Tom Weeden <tcweeden@execpc.com>
Date: Tue, 27 Feb 96 13:48:57 -0500
To: aprssig@tapr.org
Message-ID: <199602271952.NAA14311@mail.execpc.com>
Rendered body type: text/plain

Our county's emergency management office is about to purchase at least
one Ultimeter (not known yet if it's a U-II or U-2000) and send the data on its
siren control radio link back to the county's EOC. They have offered to give us
a "split" of the Ultimeter's data output so we could dump it out onto 145.79. The
question is: does the on-site APRS computer or the TNC need to query the
Ultimeter or can it just sit there and receive the RS-232 output of the instrument?
(Assuming that we can't talk TO the Ultimeter, as that would interfere with the
county's link...)

> on an existing radio channel...
> question is: does the on-site APRS computer or the TNC need to query the
> Ultimeter or can it just sit there and receive the RS-232 output

WB4APR REPLY COMMENT: Query not required. Just tap off the data (1 wire
and ground). If the Ultimeter is sending continuous data (data logger
mode) then use a GPS capable TNC programmed to periodically transmit the
desired string. If the Ultimeter is in packet mode, then any TNC in
unproto converse mode will work.

```
Howdy folks...

As listed by Bernie, WM3L, we have established an APRS WIDE/RELAY at a
good elevation in the Scranton area.  The TNC is an MFJ-1270, running
X1J-4.  The TNC was removed from usage in a backbone stack on regular
Packet. (ie the chip was already burned in).  I have a few questions...

We got the TNC PARAMS / MODES from an issue of CQ.  I thought, but cannot
prove, that there was an error in the initial listing, which resulted in
an addendum in a following CQ.  What are the PROPER settings for this
TNC?

We seem to be having trouble in telling the TNC to "ID" with parameters
that would cause it to "pop up" on your screens.  What function within
the TNC controls this, and what needs to be entered?

Is this new WIDE/RELAY adversely affecting anyone's effort in the
North East?

Thanks for reading... Al, N3KAE
```

I suppose that it could be done if you built a data splitter and isolated both
sides.  The unit outputs a continuous data stream so I should think that you
could build something simple.  I don't know about the U-2000 but the U-II only
has two wires that go to the serial port.

I'd also suggest just making it a remote station with a TNC and radio only.  You
don't need a computer on site...

Hi Bob,
Russell Hulbert KA1VMQ here.
5 Robinson Dr.
Bedford, MA 01730-1336

I just sent my $24 in to register my APRS shareware but I didn't enclose the
form that can be brought up on the READ ME file so I am sending you
additional information
that may be advantageous to have.

APRS frequency that I use is: 145.790

LAT/LONG = 42.29.46 N. LAT/71.14.58 W. LONG

KANTRONICS KAM+ WITH LATEST 8.0 EPROM FOR GPS (which I don't have)

Email address: KA1VMQ@aol.com

Don't know what version I have of the shareware itself but I would assume it
is the latest.

Microsoft Office allows you to have a tool bar menu and enter other applications
into beside the Office apps (Word, Excel, Project, etc).  If you don't already
have Microsoft Office its an expensive way to go just for a tool bar.
I just scanned Exec-pc BBS and they have a program you can download called
ENGAGE (at version 1.6) that sounds like it might be just what you're
looking for.
You can access it through the Internet at  http://filepile.com
Hope this helps.

Hi I'm student in Pusan National University.
My major is civil engineering.
I'm studing GPS based car tracking and controlling system.
But I have some problems to transfer data.

these are problems.

1) in APRS I have to change HSP mode to use GPS
   at the end of  changing HSP mode I must save config.
   But the error massage appear "enter APRS registration validation number, GPS number"
   How can I solve this problems?
2) Must I have dual comm port to transfer datum?
   I use notebook pc which have one com port
   Is there any posibility of pc <-> tnc  <->  tnc<->gps (in KISS mode of TNC) ?
   And what tnc radio modem configuration do I have to transfer data  GPS <-> tnc ?
3) When I only communicate TNC with GPS, can I control communication
   by serial communication program ?
   If it is possible, Where can i get this program source ?
4) I succeded in two  com  port pc.   but in  one  com port   pc I  must  use  3 branch
   port. (GPS,PC,TNC), how can I get this kind of port?
```

Bravo! This is EXACTLY what I was getting at with my message about software authors "waking up and smelling the coffee"...here is (and Bob has humorously noted the irony), the classic example of a program that really does require 3 com ports, but only two interrupts are available because of the SOFTWARE.

Don't you guys (programmers) realize how many of us are indeed using multi-tasking OS's...we've only been doing it in increasing numbers for years (since the advent of DesqView). The days of programming for the lowest common denominator dedicated 8088 are over...not that it has to be skipped or ignored, but really....the entry level machine is now a 486 with at least 4 and most likely 8 mb of ram and even an AT bus is capable of supporting 8 user interrupts, so it's not like we are asking for something only the elite few have available.

Don't take this the wrong way...it is not meant as a put down, rather a PLEA...let's make better use of what is staring us in the face... any 286 or above machine has the ability to support 8 user interrupts, and buying another machine to dedicate to every author's exclusive requirements for com1/2 and interrupts 4 and 3 respectively, is (to quote Lamar Alexander w/r to Steve Forbes), "nutty".

We seem to have had another opening last night, as I received the following stations via these paths in NY City:

WA4TFZ	Charlottesville, VA	WIDE,WIDE,WIDE*
WD4HDL-1	Goldview, VA	WIDE,WIDE*
K4LV	Great Falls, VA	WIDE,WIDE*

All three listed themselves as "#" wide's, and I got several sets of packets from each. I've truncated the paths at the asterisks for clarity.

BTW , I also saw another pesky call (via GATE, so not included above,) think it was KE4EER??? ;-{) (just a gentle rib, Bill...)

654. GPS monopole

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 28 Feb 1996 09:46:58 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960228093057.5223A-100000@greatlakes>
Rendered body type: text/plain

The whole reason that I wrote the SIGPLOT program was because I have always felt that a 1/4 wave vertical should be a good GPS antenna for most 2D applications. It has maximum gain at most elevation angles and a null overhead. GPS satellites directly overhead contribute nothing to your 2D fix, although they are useful for altitude.

Now having run SIGPLOT.bas with two identical GPS receivers, one using the TRACKPACK (patch) antenna, and one with just a 1.75 inch piece of wire stuck in the GPS antenna jack, here are the results:

ELEVATION ANGLE	AVERAGE WHIP	AVERAGE PATCH	DIFFERENCE
90 - 80	38	41	-3
80 - 70	39	44	-5
70 - 60	41	43	-2
60 - 50	42	43	-1
50 - 40	41	42	-1
40 - 30	42	41	+1
30 - 20	42	40	+2
20 - 10	40	38	+2

Rarely does a satellite go overhead, so it took 12 hours of monitoring before I finally got data above 70 degrees. But the presence of ANY gain straight up is surprising... There are other HAM antennas in the vicinity that may have reflected enough energy to fill in the null.

The ability of the whip to perform within 1 dB of the patch antenna at all angles up to 60 and even better below 45 degrees leads me to the conclusion that the whip is just fine for most terrestrial applications.

Note, no attempt had been made to TUNE the whip, nor to match its nominal 25 ohm feed impedance to the 50 ohm GPS receiver input. This is my next step. To add a 1/4 wave 35 ohm matching stripline to gain back another dB or so..

Bob-
I suspect in order to use SIGPLOT.BAS you would need a GPS receiver capable of outputting the $GPGSA NMEA data string. Not all the GPS receivers out on the market today are capable of outputting this sentence. One should doublecheck his GPS's capability before downloading and/or running the program.

I have 6 (YES SIX) Comm ports on my Macintosh, and I could add more, 4 at a time, just by plugging in another card.. The only limit is the number of slots in the machine. I currently use 3 comm ports all of the time, and will be using another soon with the DFJr RDF unit..

For testing, I have even had two GPS units running at the same time...

And that is all JUST for APRS..

WB4APR REPLY COMMENT:  Correct.  It uses the GPGSV sentence.  If your GPS
does not output this sentence, then SIGPLOT will not work.  But since the
program is in BASIC, anyone whould be able to modify it to use whatever
data is available from their GPS...  Good luck.

658. Re: APRS 7.5 on HP200LX

From: Mike Musick <71301.3106@compuserve.com>
Date: 28 Feb 96 11:36:25 EST
To: <aprssig@tapr.org>
Message-ID: <960228163624_71301.3106_FHJ70-1@CompuServe.COM>
Rendered body type: text/plain

```
>Can you summarize your configuration and how you got it going on your HP200?

Sure, Greg.

It's actually pretty easy. The 200 is a stock 1MB unit, with a 640/360 split on
the onboard RAM (in other words, max'ed DOS addressable RAM), and APRS lives on
a 10MB SunDisk flash RAM card. Connection and use so far has been primarily in
testing as a *stationary* unit, using HP's serial cable with the modem adaptor
to the TNC. I am in the throes of debugging an HSP (hardware single port)
adapter to run it mobile with a GPS, and barring my wiring goofs it appears
that everything should work fine that way.

You do have to run it out of raw DOS. I attempted to make it executable from
the App Manager, but between AM and Filer there is just not enough RAM left to
run APRS. It's completely straightforward on the install, and it runs cleanly.

There are some downsides to this "pocket APRS". Lack of color is a minor
problem, and, obviously, the display's aspect ratio is all wrong. Maps are
pretty badly distorted horizonally (normal displays are 3:4, the HP's is 2:5).
Maps are slow to draw; the map I've been using in my testing (MOSTLOUS.MAP)
takes 20 seconds to paint after hitting the space key. The little experience
that I've had with GPS operation on it already reveals that I had better be
careful on the update/redraw rate or it'll spend more time redrawing than
actually displaying something. I'm gritting my teeth about some of the more
complex maps that I might run into on the upcoming trip, anticipating 1-2 min.
redraw times.

Upgrade possibilities are numerous. There is an outfit (Times2 Tech) that has a
doublespeed modification for $50 consisting of a crystal and LC network with
software that twiddles the uP registers to tell it about the fast clock. If I
wasn't short on prep time I'd do it *now*! The same people also have an
on-board modification which adds 4MB of internal RAM. It's difficult to justify
at $400, considering that new 10MB PC cards show up from time-to-time at
$200-250. However, as soon as I get the DF interface going, I need to think
about the idea of adding additional serial ports, which would then take the PC
card slot, and there goes my online memory. Decisions, decisions...

[Muddying these waters A LOT is the upcoming IBM ThinkPad 110 - a full 486/33
palmtop, with a color display. And it runs Windows 95. Hmmm. Its estimated $2K
may be a lot for a palmtop, but considering the $1K already spent on the HP and
add-ons, and what I could still potentially add to it, the price difference to
get a real 486 with color display starts getting incrementally smaller.]

But even with the limitiations, the HP200LX a fun and useful way to run APRS.
Once the HSP is debugged, a couple of spots of Velcro go on the HP to turn it
```

into an on-dash display. Way cool! ;-)

(Note to BobB - would it be possible to have a tweak for the aspect ratio?)

Adding potential fuel to the COM port fire...

There is a fairly cheap ($90) device sold in the Macintosh market called "Port Juggler". It is a 1-to-4 serial port expander which uses a driver to handshake the routing selections between the attached devices and the computer. I've not used one yet, I just know it's out there.

This could be explored for those "beyond HSP" situations. How adaptable it would be to the DOS environment is up to the those code gurus who can write drivers. I envision a TSR which would take calls to COM1-COM4 and route them out a single port to this switch. Or, lacking that, APRS could do the switch handshaking itself.

Minor downside is that this device uses the Mac serial port connector standard, which is 8-pin mini-DIN.

Rendered body type: text/plain

Bob (APR),

I may have missed it recently, but I'm wondering what the status of
the latest MIM module is. Is your plan to show it at Dayton? I'm very
interested in telemetry with APRS and can't quite decide from what I
read, if telemetry is actually "fully" implemented in APRS or not. If
I produce the packets from say a Basic Stamp PIC connected to a TNC
using the proper telemetry protocol, will APRS 7.5 process them?

Bottom line...when can I get a MIM module and use it with APRS?

Thanks,
Card Smith

666. QST patch antenna

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 28 Feb 1996 14:24:45 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960228135836.11954E-100000@greatlakes>
Rendered body type: text/plain

This is an update to my earlier ELEVATION data. I hooked up the LRF
Designs GPS patch antenna made from the plans in QST and ran it for 2
hours. It clearly has better performance than both the monopole and
TRACKPACK antenna above 35 degrees and slightly less below that.
I have added it to the previous data as shown below. I am using the
Garmin TRACKPACK antenna as a reference. All readings are in dB as
output by my GARMIN GPS-20 card.

```
ELEVATION  REFERENCE  TEST    QST DESIGN
ANGLE      TRAKPACK   WHIP    LRF PATCH
90 - 80       41     38  -3    50  +9
```

```
80 - 70       44     39  -5    51  +7
70 - 60       43     41  -2    49  +6
60 - 50       43     42  -1    49  +6
50 - 40       42     41  -1    48  +6
40 - 30       41     42  +1    35  -6
30 - 20       40     42  +2    37  -3
20 - 10       38     40  +2    38   0
```

**** THIS WAS ONLY A 2 hour test, but I wanted to get this posted to let
you see what is going on. These tests should be runovernight or for 24
hours in order to get a real smooth average. AND remember that AZimuth
is ignored. Meaning that one satelite to the east at 40 degrees
elevation will be averaged with any other satellite at any other azimuth
that also passes through 40 degrees. So if you are going to make
measurements, you must be sure to have a clear omnidirectional horizon
AND you must be using a TRUE omin antenna design in the horizontal plane.
Otherwise you will have to plot a 3D antenna pattern including AZIMUTH
data to account for anomolies in your azimuth pattern. Then you also
have to run for a full 24 hours or many days in order to get enough data
points. USE THIS AS A FIRST APPROXIMATION TOOL ONLY.

> data as is...?

WB4APR REPLY COMMENT: Yes, All APRS versions for the last year and ahalf
will decode the APRS telemetry packets. The MIM is in full production
and we have been selling them for a month. They are $89 plus $4 shipping
and handling. Please indicate type of GPS unit that you will be using....

Order from Clement Engineering, PO box 1086, Severna Park, MD 21146
phone 410 268-6736 and FAX 268-4612. Visa and MC accepted. For
technical details see APRS\README\TELEMTRY.txt or use email to
wiclement@aol.com.

>data is available from their GPS... Good luck.

Bob, I'd like to modify SIGPLOT to use GSA data, but I need to know the GSV format so I can make the
conversion. Can you fill me in on that?

Fantastic little program, BTW!

Larry Griffin asked for the format of the $GPGSV sentence that my SIGPLOT program uses to plot the elevation pattern of any given antenna. He wants to modify the program for a different GPS format that also reports satellite signal strength. I encourage anyone that wants to tackle the AZIMUTH display to also go for it..... But lemme know what you are doing so we dont duplicate efforts.

```
$GPGSV,X,X,XX,XX,XX,XXX,XX.......
       | | |   | |  |   |
       | | |   | |  |   * --- SNR                 } These four items
       | | |   | |  * ------- AZ                  } repeat for up to
       | | |   | * ---------- EL                  } 4 sats per GPGSV
       | | |   * ------------ Satellite PRN number} sentence
       | | * ---------------- No of sats in view
       | * ------------------ Message number 1 to 4
       * -------------------- Number of messages
```

So my GPS-20 is outputing two GPGSV's per two second period, This reports a total of 8 satellites. SIGPLOT.bas ignores the first three items, and only parses for the four individual satellite data

I also use six ports in my PC....it is no big deal, IF the
software is written properly, i.e., for dos apps, allowing
the user to specify the address and interrupt for any required
 serial
ports, for os/2 apps it is specified in the config.sys,
 for Win95, it is
in setup. The big problem is dos apps...they
 must have coded in the
ability to specify address and interrupt,
 os/2, win95, and Macs handle it
more directly in that the apps
 look to the OS for com port handles, so
whatever the OS knows
 about can be used. It is not hard in DOS, but
requires more
 original code.

I don't think this would help.  The devices attached to a juggler can't
be accessed at the same time ... it switches (electronically) between
them ... I think it would give the TNC fits!

Well, fooey.  I was thinking the $GPGSA sentence had the az/el/snr info but I
was wrong!  On further examination, it doesn't look like my Mot OnCores can
send any sentences with that info.  So I guess I'm outta luck with these rcvrs.
I presume the Garmin-45 can send $GPGSV?

BUT, it looks like Bob's little program just needs a _little_ more work to add
azimuth plotting.
Then it should be able to provide a plot that would make a terrific PHG circle
that could maybe be overlayed on the maps.
You'd be able to see just what effects are caused by the surrounding terrain.
Of course it would need some scaling to account for PHG factors, but the
general shape would probably be pretty close, wouldn't it?

Larry Griffin <largriff@onramp.net>

OM ports

Can anyone suggest a manufacturer of a "com prot expander" that can be sued
with a portable IBM compatible PC? Preferably it shoud use D-style connectors
for the device side. I find the edge connectors used with a PCMCIA card to be
very unreliable in the field.

Thanks,

Sid Bennett, K1AW

Here is Civil Engineering Dept. of Pusan Univ. in South Korea.

Because I have a problem about APRS, please help me !

-----------------------------------------------------------------------------------------
Problem : After HSP mode is contacted to PC, APRS configuration is done between PC and
          TNC. In APRS configuration, it is saved with ALT-S key.  When APRS
          configuration is saved, APRS need to validation number, GPS number etc. But I
          don't know this numbers. How do I put there to some number ? And if for this I
          registrate any group, Do I registrate there in any method ?

```
=====================================

             CROSS-COUNTRY APRS EVENT ANNOUNCEMENT

             =====================================

     Starts: 3/1/96

     Ends: 3/16/96

     Route: US66/I-40 from St. Louis to Barstow, CA;
            One week in central CA and Bay Area;
            I-80 (approximately) return to St. Louis.

     Frequency: 145.790 MHz; exc. California: 145.010

     Call: N0QBF

     Symbol: Jeep (to represent my 4x4 Explorer)

     Via: WIDE,WIDE (we're running 50W)

     Estimated Itinerary:

        3/1 - St. Louis, Springfield, Joplin
        3/2 - OK City, Amarillo, Tucumcari
        3/3 - Tucumcari, Albuquerque, Flagstaff
        3/4 - Flagstaff, Needles, Barstow
        3/5 - Calif. High Desert incl. Tehachapi
        3/6 - Bakersfield, Paso Robles
        3/7 - (off)
        3/8 - Paso Robles, Stockton
        3/9 - (off)
        3/10 - Stockton to Bay Area
        3/11, 12 - Bay Area (at random)

        Return trip via I-80 starts 3/13 and is not tightly
        scheduled, but expect the *approximate* cities:

        3/13 - Oakland, Sacramento, Reno
        3/14 - Elko, Salt Lake City, Laramie
        3/15 - Cheyenne, Lincoln, Omaha (bypass)
        3/16 - Kansas City, Jefferson City, St. Louis <whew!>

DISCLAIMER!: This is our *vacation*, so all of the above is subject to
equipment glitches, schedule dynamics, and random spousal interference! ;-)

----------------------------------------------------------------
```

Sorry about the short notice, gang. After several late evenings out in the truck in sub-freezing temps, I *finally* got all the bugs out of the mobile APRS setup last night, with a test drive at 1 AM! A recalcitrant MacAPRS in the house (my fault - baud rate!) didn't help things, either. It worked fine this morning on the way into the office, so I think it's solid.

Unless someone objects or advises otherwise, I'll leave the POS interval at 3 minutes.

I will likely get protests about leaving "BEEPS" on, so if I don't respond to a message or bulletin, that's because I'm silent running and obviously won't hear the alert. Sometimes the system will be in tracker-only mode, too. Just ignore any GPS commands coming over the frequency when I forget to change TNC modes before switching! <grin!>

[Suggestion for BobB - it would be nice to selectively silence beeps by type. Routine transmit beeps and digipeat-loss alarms get annoying when running mobile for any length of time, yet we still need to know about incoming bulletins, messages, and new stations when they happen. But then, maybe this feature is already there and I just haven't chanced into it yet.]

I will be "unsubscribing" the maillist while we're gone so my mailbox doesn't

```
collapse under the weight of the normal traffic here, but will be on until
midday tomorrow (Friday, 3/1). I'll re-subscribe on returning, and also
retrieve the archived messages.

Looking forward to a fun trip!

  ...mike musick/N0QBF

In a message dated 96-02-27 11:42:20 EST, you write:

>I just wrote a program called SIGPLOT.bas which will plot a complete
>elevation profile of your omni antenna.  It uses the RF from the
>constellation of GPS satellites as a signal source, and any cheap GPS
>receiver to give you AZ, EL and signal strength!  Just scale any antenna
>design to 1575 MHz and place it outside, hook up a GPS receiver to your
>serial COM port, and watch the profile develop.
>

Hi Bob,

Very clever idea you came up with to instrument the performance of GPS
antennas! I have been playing around with various versions of the QST patch
antenna, but it is very hard to find antenna test equipment that works up at
1575 mhz. Your idea should be very useful to us experimenters.

My subjective experience with the QST patch antenna is that it works very
well for higher elevations, but is worse for the lower angles than their
standard quadf antenna. I will try out your program in order to get actual
numbers to verify this.

I have a Garmin 45, and will try out your program shortly. I am wondering if
changing the spacing on patch antenna might balance out the pattern better
for the lower angles. Have you seen any software that would be useful in
modeling patch antennas? It would sure save a lot of cutting and trying!

Also, I was pondering if the 1575 mhz patch antenna could be scaled to 440
mhz for
possible pacsat email/aprs use?

>Colorado Feels Slighted!

Oops. Sorry, Art! No slight intended. If we had time left, we'd venture south
to visit a ham friend in Colorado Springs.

Aside from the snow/mountain pass issues, if truth be told, I'm a railfan. So
one of the main purposes of the northern E/B route is to take-in the Union
Pacific in Wyoming and Nebraska, where they run 'em fast, furious, and
frequent!

The W0TX digi is noted. If I see traffic from it and am in a position to change
the configuration, I'll do so. Manipulating the palmtop and driving, however,
are mutually exclusive activities!

Hi all,
I think one of my two new APRS Digi's is going on line today.
It's call is KE6RKE-3,and it will connect Reno,Carson City,
South Lake Tahoe and even Falon Nv.to Ca.on 145.01 it's position
path of APRS via wide will let it be seen by Uall in Ca.I hope.
It's location will say APRS(WIDE)Digi !3908.47N/12014.40W//A=008637
I am very excited//A=008637 is way up there...k
Thanks for all the help Scott 73 & hope we all see some new
stations on the map tonight.

693. APRS Standard TINY Intface cable

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 29 Feb 1996 23:45:01 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960229233842.3499A-100000@greatlakes>
Rendered body type: text/plain

Tonight while completing a TINY self-contained stand-alone tracker, I
needed to be able to both program the GPS and the TNC (MIM module).
I used a pair of 1/8 inch stereo phone jacks. Then I made a serial port
cable for my laptop with a 1/8 inch stereo PLUG on the end. If you use
the "closed circuit" type stereo jacks, you have a total of four switched
contacts that can give you a LOT of flexibility as to what is connected
to what, when.

One JACK is labeled GPS, the other is labeled TNC. All I do is plug
into the one I want to communicate with. The output of the GPS is
crossconnected to the input of the TNC when nothing is plugged in.
But as soon as you plug into the TNC jack, it disconnects the GPS.
In this case, I am only using one of the "closed circuit" contacts.
This is the same configuration that I used for the "FOOTBALL HELMET".

In once sense, the phone jacks are less waterproof than a DB-9, but
by countersinking them so they mount flush, (Had to do that since the
PVC pipe was too thick anyway) then you can seal them perfectly with
a simple piece of tape.

The point of all this, is that the three wire stereo phone plug/jacks
make excellent serial port connectors, especially with the closed
circuit switching contacts. SO I propose a standard. The TIP is
RXD going to the PC, the RING is TXD and the sleeve, of course, is
ground. Notice that this plug will also work if you PLUG it into some
of the GPS units that use a 1/8 inch plug for their NMEA out.

```
     APRS "standard"                AT STYLE
     1/8 inch SERIAL                 DB-9 F
     STEREO PLUG                   serial port
     ---------------               -----------

        TIP  *-----------------------* 2 RXD

        RING *-----------------------* 3 TXD

        SLVE *-----------------------* 5 GND
```

Consider it. If you need a tiny 3 wire serial interface, this sure is
pretty small. Without a standard we all have a 50:50 chance of doing
it differently, hi hi.

694. Re: [APRSSIG:7137] Re: I need more COM Ports!

From: Michael Markmann <ve4mjm@draco.bison.mb.ca>
Date: Thu, 29 Feb 1996 19:23:19 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <Pine.LNX.3.91.960229191747.15996A-100000@draco.bison.mb.ca>
Rendered body type: text/plain

In regards to everybody's comments, pleas, etc. about more COM ports
needed in APRS:

I don't think you all realise that the problem with only being able to
use COM1 and COM2 (and I think 3 and 4) is due to limitations in QUICK
BASIC that it only supports COMs 1 and 2 without having to write machine

language code and intergrate (sp?) it into the Basic program. At least
that's what I see as being the main problem after a quick scan of Basic's
online help.

If that's not the case, I'd love to be wrong!

Michael

WB4APR REPLY COMMENT: Be sure to put in the PHG format so that
appropriate range rings will be plotted. I assume that 8637 is height
above sea level, and average terrain is probably 6000' ? so your HAAT is
probably about 2600?

WB4APR REPLY COMMENT: Exactly. And trying to write special code for all
the possible additional combinations and all the potential conflicts is
just not worth it. Now that APRS works with a BUS mouse, then it can do
everything it needs with 2 ports. If everyone else's softare is so
flexible, then move all their COMM needs to COM 3 through COM n, and leave
APRS alone, hi hi...

```
>
   Using an X1J release 2 node here, configured for an APRS digi. Was
originally configured for TCP/IP and NETROM, but no real support or interest
so I configured it remotely as the APRS digi.

   What do you want to do with it? Intended use determines how you will
configure it when the eprom is "burned" and the choice of arguments for the
different parameter and mode subcommands.

   I did not get overly fancy with mine, and I am sure all is not as you
may want it, but basically I disabled the IP router by leaving all the
tables blank, thereby making that function brain dead, due to massive
ignorance. The NETROM function is also cut off by blank tables and several
parameter/mode entries. The digi function is left intact for APRS use and
keyboard to keyboard. I and one other person can connect and get stats
, etc. and control it, everyone else is refused.

   The software is well documented, specific questions I may be able to answer
so you do not have to reinvent the wheel.

Youngku-

If you want the HSP to work, you must get a registration from WB4APR who is the author of APRS.

The information is in a file called register.txt in the readme subdirectory.

The APRS registration is $24.00 US   and the GPS registration is another $14.00 US.

I quote, from AT&T's web site:

"Local, long distance, or 800 facility access charges to reach AT&T WorldNet Service will also apply for all pricing plans"

Doesn't sound any better than AOL, which also allows "rural America [to be] connected to the rest of the world"...for a price, of course. AT&T also is non-Mac compatible.

Subject: [APRSSIG:7156] Re:Internet access

Newsflash!!!!!?

For those that must spend the long green from the cedar swamp outback of
America, comes this nugget of Rumor?.....
ATT offers its customers World Net Service. Internet access 5 hrs per month free, $2.40 per hour over 5 hrs, or $20 unlimited per month. If the
rumor is true, rural America has been connected to the rest of the world.
Call 1-800-967-5363 for software package and?

Pete, wa4hei

PS. This should not be construed as an advertisement!!!!!!

According to the newspaper article I read, the AT&T Internet service will not be
available until March 14th. In addition, the FREE service will ONLY be offerred
to customers of AT&T Long Distance at first...

Bob,
We understand that it is a real problem for you to code the com port
easily, so, if you happen to find an easy way to implement it, then
it should ask the following:

com port number
hex address (there is NO standard after com 2)
IRQ value (in either hex or decimal)

I can talk to Tom Dandrea (he write log-eqf) and ask how he did it if you
like. The users that use an operating system that does more are always
juggling ports around to find something that fits.

Many thanks in advance and we are hoping that you will keep this in the
back or your mind.

cheers...mike

And this is just what every author tends to do...let the other
 guys
worry about it. In any case, the market always solves the
 problem. Some
one sees the need, speaks to the market and
 wa la...we have WinAPRS. No
more port conflicts. No more
U-2000 overruns. No more failing to run in the background on
 a
multitasking machine.

And it is not "everyone else's software" that is so flexible, it is
 the
very few...that is why people are whining and sniveling (me
 included),
about more software authors "seeing the light" and letting
 the USER
choose the address and interrupt for com ports.

Keep in mind, I am not lobbying for dos APRS to do anything ...I don't
use it anymore. I am lobbying for software authors in general, and more
specifically in the ham community to move away from the assumption that
their program owns the machine and is its sole use. That just isn't true
anymore, nor should it be. End of thread for me. I will reserve my
comments for specific authors of software that I run or want to run.

     Hmmm.  NOT an advertisement.  Aside from the fact it
names the product, describes it, says who's got it, gives
a price for it as well as a toll-free number to sign up
for it...why in the world would I get the idea it was an
advertisement?  Excuse me, I thought this SIG was about
APRS with occasional forays into GPS and DIRECTLY related
subjects.  So how could I possibly get the impression this
was an advertisement.

     I remeber hearing some old saying that goes "If it
looks like a duck, quacks like a duck and waddles like a
duck..."

Hi Peter and tnx for the reply...

You may have missed my original message posted a day or so before the one you just replied to. The problem at the moment is the TNC we are using has already been burned, and has been removed from a backbone use on regular Packet.

The TNC ID's on schedule, but does not show up on our maps, nor does it send its UI through an UNPROTO path. We would like to set the UNPROTO to APRS,WIDE,WIDE for now... we already have the lat/long/PHG/text string entered into the BTEXT. Any suggestions??? Are you seeing NE PA on VHF??

We have just purchased a new MFJ 1270C and intend to have an X1J-4 burned specific for APRS. All of your input is greatly appreciated to both of these matters... especially the new node burning.

tnx es 73

For whatever it's worth, I have shut down my bulletin board because it won't reliably run on Com 3 and Com4 under Windows (FBBS software) and will continue to leave it down until the Windows version is released later this month. I don't want to have to spend the extra time to have to shut down WinAPRS or DOS-APRS or Internet or vice versa whenever I need to run one of the other applications.

19. Mapfix improvements

From: Mike Tyrrell <100321.1327@compuserve.com>
Date: 01 Mar 96 19:10:02 EST
To: "'APRSSIG'" <aprssig@tapr.org>

Rendered body type: text/plain

Having just got hold of a spare digitizer from work I've been playing with Mapfix 2.2 but so far with only partial success. I got the digitizer configured OK and found that it outputs in the following format

xxxx,yyyy,b   Where xxx and yyy are FOUR digit coordinates and b is the button number

However, it will not calibrate correctly in Mapfix. Having had a look as the source code the problem is in the way that the coordinates are read in the calibrate routine. At present this assumes a FIVE digit coordinate and extracts the numbers from the input string in fixed columns. This results in only the last three digits of the y coordinate being read.

In the actual xy point input routine you extract the x and y coordinates based on the location of the comma in the input string. I think all you need to do is use the same formula in the calibration routine.

I wanted to try this mod out but I only have QBASIC here and the MAPFIX22.BAS program refuses to run giving an "Out of memory" error.

Another problem with my digitzer is that the button number is returned in the range 1 - 4 (instead of 0 - 3). Perhaps during the calibration routine Mapfix could ask for the buttons to be pressed in turn and then remember those inputs. You could even make the buttons user programmable by allowing a command to be associated with the button by the user.
